## ABOUT THE MANUAL

This manual supplies the necessary information for the operation of the CFW900 frequency inverter using the Modbus RTU protocol. This manual must be used together with the CFW900 user's manual and programming manual.

## ABBREVIATIONS AND DEFINITIONS

|              |  |
|--------------|--|
| <b>ASCII</b> | American Standard Code for Information Interchange |
| <b>CRC</b>   | Cyclic Redundancy Check                            |
| <b>EIA</b>   | Electronic Industries Alliance                     |
| <b>RTU</b>   | Remote Terminal Unit                               |
| <b>TIA</b>   | Telecommunications Industry Association            |
| <b>LSB</b>   | Least Significant Bit/Byte                         |
| <b>MSB</b>   | Most Significant Bit/Byte                          |
| <b>ro</b>    | Read only  |
| <b>rw</b>    | Read/write   |
| <b>cfg</b>   | Configuration                                      |

## NUMERICAL REPRESENTATION

Decimal numbers are represented by means of digits without suffix. Hexadecimal numbers are represented with the letter 'h' after the number. Binary numbers are represented with the letter 'b' after the number.

## DOCUMENTS

The Modbus protocol was developed based on the following specifications and documents:

| Document   | Version | Source     |
|--|---------|------------|
| MODBUS Application Protocol Specification, December 28th 2006. | V1.1b   | MODBUS.ORG |
| MODBUS Protocol Reference Guide, June 1996.                    | Rev. J  | MODICON    |
| MODBUS over Serial Line, December 20th 2006.                   | V1.02   | MODBUS.ORG |

In order to obtain this documentation, consult MODBUS.ORG, which is nowadays the organization that keeps, publishes and updates the information related to the Modbus protocol.

## 1 MAIN CHARACTERISTICS

Below are the main characteristics for Modbus RTU communication of the frequency inverter CFW900.

- Interface galvanically insulated and with differential signal, providing more robustness against electromagnetic interference.
- It allows the device to operate as Modbus RTU slave.
- Allows data communication for equipment operation and parameterization.

### 1.1 MODBUS RTU

Two transmission modes are defined in the Modbus protocol specification for the serial interface: ASCII and RTU. These modes define the way the message bytes are transmitted. It is not possible to use the two transmission modes in the same network. The CFW900 frequency inverter uses only the RTU mode for the telegram transmission.

It allows up to 247 slaves, but only one master.

It adds to the Modbus PDU an address and error-checking field. The association of these fields to the PDU is called ADU (Application Data Unit).

Modbus RTU telegram format:

- Address: used to identify the slave.
- PDU: Modbus PDU.
- CRC: field for checking the transmission errors.

The master initiates the communication sending a byte with the address of the slave to which the message is destined. When sending the answer, the slave also initiates the telegram with its own address. The master can also send a message to the address 0 (zero), which means that the message is destined to all the slaves in the network (broadcast). In that case, no slave will answer to the master.

The last part of the telegram is the field for checking the transmission errors. The used method is the CRC-16 (Cycling Redundancy Check). This field is formed by two bytes; where first the least significant byte is transmitted (CRC-), and then the most significant (CRC+). The CRC calculation form is described in the protocol specification.

In the RTU mode there is no specific character that indicates the beginning or the end of a telegram. The indication of when a new message begins or when it ends is done by the absence of data transmission in the network, for a minimum period of 3.5 times the transmission time of a data byte (11 bits). Thus, in case a telegram has initiated after the elapsing of this minimum time, the network elements will assume that the first received character represents the beginning of a new telegram. And in the same manner, the network elements will assume that the telegram has reached its end when after receiving the telegram elements, this time has elapsed again.

If during the transmission of a telegram the time between the bytes is longer than this minimum time, the telegram will be considered invalid because the frequency inverter will discard the bytes already received and will mount a new telegram with the bytes that were being transmitted.

For communication rates higher than 19200 bit/s, the used times are the same as for that rate. The next table shows us the times for different communication transmission rates:

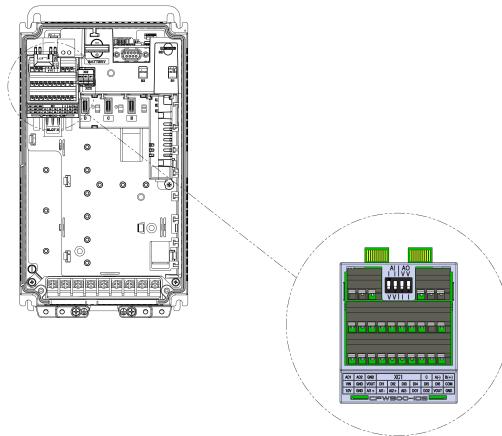

**Table 1.1:** Communication rates and the time periods involved in the telegram transmission

| Baud rate    | $T_{11bits}$ | $T_{3.5x}$ |
|--------------|--------------|------------|
| 1200 bits/s  | 9.167 ms     | 32.083 ms  |
| 2400 bits/s  | 4.583 ms     | 16.042 ms  |
| 4800 bits/s  | 2.292 ms     | 8.021 ms   |
| 9600 bits/s  | 1.146 ms     | 4.010 ms   |
| 19200 bits/s | 573 $\mu$ s  | 2.005 ms   |
| 38400 bits/s | 573 $\mu$ s  | 2.005 ms   |
| 57600 bits/s | 573 $\mu$ s  | 2.005 ms   |

- $T_{11bits}$  = Time for transmitting one byte of the telegram.
- $T_{3.5x}$  = Minimum interval to indicated beginning and end of a telegram ( $3.5 \times T_{11bits}$ ).

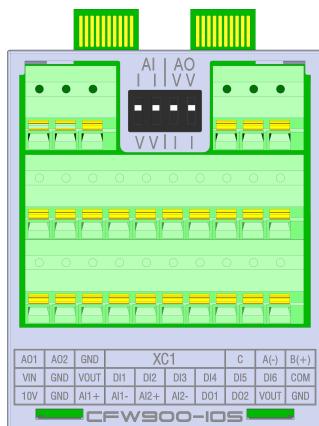

## 2 INTERFACE DESCRIPTION

The CFW900 frequency inverter uses the RS485 accessory to provide a Modbus RTU interface for communication. Characteristics of this interface are described below.

*Figure 2.1: Details of the IOS accessory installed in slot X.*

### 2.1 RS485 ACCESSORY

CFW900-IOS:

- Standard accessory installed in slot X.
  - It has a built-in RS485 serial interface.

### 2.2 CONNECTOR

The connector pinout is presented in table 2.1.

*Table 2.1: Pin assignment of connector for RS485*

| Name | Function   |
|------|--|
| B(+) | RxD/TxD positive   |
| A(-) | RxD/TxD negative   |
| C    | 0V isolated from the RS485 circuit, used to enable the connection of this point to the reference 0V of the other network devices |

## **2.3 INDICATION**

Details on the alarms, communications failures and communication states are made through the keypad (HMI) and product parameters.

### 3 INSTALLATION OF THE EQUIPMENT IN NETWORK

For the connection of the frequency inverter CFW900 using the RS485 interface, the following points must be observed:

#### 3.1 COMMUNICATION RATE

The RS485 interfaces of the CFW900 frequency inverter can communicate using the rates defined on the table 3.1.

*Table 3.1: Supported baud rates*

| Baud Rate   |
|-------------|
| 9600 bit/s  |
| 19200 bit/s |
| 38400 bit/s |
| 57600 bit/s |

All network equipment must be programmed to use the same communication baud rate.

#### 3.2 ADDRESS IN THE MODBUS RTU NETWORK

Each Modbus RTU network device must have an address, and may range from 1 to 247. This address must be unique for each equipment.

#### 3.3 TERMINATION RESISTOR

The use of termination resistors at the ends of the bus is essential to avoid line reflection, which can impair the signal and cause communication errors. Termination resistors of  $120 \Omega | 0.25 \text{ W}$  must be connected between the signals +B and -A at the ends of the main bus.

It worth to mention that, in order to allow the disconnection of the element from the network without damaging the bus, it is interesting to put active terminations, which are elements that only play the role of the termination. Thus, any equipment in the network can be disconnected from the bus without damaging the termination.

#### 3.4 CABLES

Recommended characteristics of the cable used in the installation:

- It is recommended the use of a shielded cable with a twisted pair for the signals +B and -A, 24 AWG minimum.
- It is also recommended that the cable has one more wire for the interconnection of the OV reference signal.
- Maximum length for connection between devices: 1000 m.

To perform the installation, it is recommended the use of shielded cables specific for use in industrial environment.

#### 3.5 CONNECTION IN THE NETWORK

In order to interconnect the several network nodes, it is recommended to connect the equipment directly to the main line without using derivations. During the cable installation the passage near to power cables must be avoided,

because, due to electromagnetic interference, this makes the occurrence of transmission errors possible.

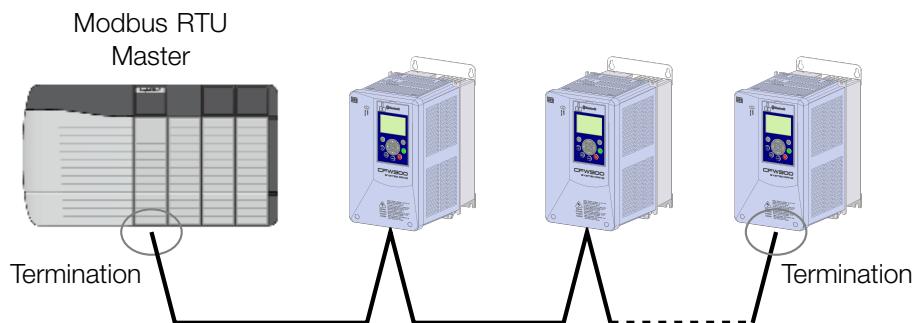

Figure 3.1: Modbus RTU network installation example

In order to avoid problems with current circulation caused by difference of potential among ground connections, it is necessary that all the devices be connected to the same ground point.

The maximum number of devices connected to a single segment of the network is limited to 32. Repeaters can be used for connecting a bigger number of devices.

### 3.6 RECOMMENDATIONS FOR GROUNDING AND CABLE PASSAGE

The correct connection to ground reduces problems caused by interference in an industrial environment. Below are some recommendations regarding grounding and cable passage:

- It is recommended the use of equipment suitable for the industrial environment.
- The cable must be laid separately (and far away if possible) from the power cables.
- All the network devices must be properly grounded, preferably at the same ground connection.
- Always use shielded cables, as well as connectors with metal housing.
- Use fastening clamps in the main grounding point, allowing a greater contact area between the cable shield and the grounding.
- Avoid connection of the cable in multiple grounding points, especially where groundings of different potentials are present.

## 4 S STATUS

This menu contains the status information of the inverter, motor, control accessories and networks. It is also possible to access information related to the functional safety of the inverter. It allows viewing the reading variables of the CFW900.

### NOTE!

All parameters in this menu can only be viewed on the HMI display, and cannot be changed by the user, unless they are linked to the parameters in the **Configuration** menu.

## S5 COMMUNICATIONS

It allows viewing the parameters used for monitoring and controlling the CFW900 inverter using communication interfaces.

### S5.1 Status and Commands

It allows viewing the CFW900 logical status and commands.

#### S5.1 Status and Commands

|                  |                      |
|------------------|----------------------|
| .1 Status Word 1 | 0 ... 15 Bit         |
| .2 Speed         | -200.00 ... 200.00 % |
| .3 Status Word 2 | 0 ... 15 Bit         |
| .4 Status Word 3 | 0 ... 1 Bit          |

**.1 Status Word 1** It indicates the operating status of the inverter. Each bit represents a status.

| Bit                    | Value/Description   |
|------------------------|---|
| Bit 0<br>STO           | <b>0 = No:</b> STO function is inactive (inverter operational)<br><b>1 = Yes:</b> STO function is active (inverter locked)  |
| Bit 1<br>Run Command   | <b>0 = No:</b> no run command active<br><b>1 = Yes:</b> run command active  |
| Bit 2<br>Local         | <b>0 = No:</b> inverter in Remote command mode<br><b>1 = Yes:</b> inverter in Local command mode (via HMI)  |
| Bit 3<br>Not used      | Not used.   |
| Bit 4<br>No Quick Stop | <b>0 = No:</b> quick stop command active<br><b>1 = Yes:</b> no quick stop command active  |
| Bit 5<br>2nd Ramp      | <b>0 = No:</b> 1st Ramp acceleration and deceleration by C6.1.1 and C6.1.2<br><b>1 = Yes:</b> 2nd Ramp acceleration and deceleration by C6.1.4 and C6.1.5                 |
| Bit 6<br>Config. Mode  | <b>0 = No:</b> inverter in normal operation<br><b>1 = Yes:</b> inverter in configuration status. It indicates a special condition in which the inverter cannot be enabled |
| Bit 7<br>Alarm         | <b>0 = No:</b> without alarm<br><b>1 = Yes:</b> with alarm active   |
| Bit 8<br>Running       | <b>0 = No:</b> motor is stopped<br><b>1 = Yes:</b> motor is running according to reference and command  |
| Bit 9<br>Enabled       | <b>0 = No:</b> inverter is general disabled<br><b>1 = Yes:</b> inverter is general enabled  |
| Bit 10<br>Reverse      | <b>0 = No:</b> motor running in the forward direction<br><b>1 = Yes:</b> motor running in the reverse direction   |
| Bit 11<br>JOG          | <b>0 = No:</b> no JOG command active<br><b>1 = Yes:</b> JOG command is active   |
| Bit 12<br>Remote 2     | <b>0 = No:</b> inverter in Remote 1 command mode<br><b>1 = Yes:</b> inverter in Remote 2 command mode   |
| Bit 13<br>Undervoltage | <b>0 = No:</b> without undervoltage<br><b>1 = Yes:</b> with undervoltage  |
| Bit 14<br>Not used     | Not used.   |
| Bit 15<br>Fault        | <b>0 = No:</b> normal operation<br><b>1 = Yes:</b> fault acting   |

**.2 Speed** It indicates the actual speed of the motor driven by the inverter in percentage of the maximum speed.

- S5.1.2 = 0.00 % ⇒ motor speed = 0 rpm
- S5.1.2 = 100.00 % ⇒ motor speed = C4.3.1.1.2

Intermediate or higher speed values can be obtained by using this scale. For example, if the value read is 25.0 %, considering C4.3.1.1.2 = 1800 rpm, to obtain the value in rpm you must calculate:

100.00 % : 1800 rpm  
25.00 % : Speed

$$\text{Speed} = \frac{25.00 \times 1800}{100.00}$$

$$\text{Speed} = 450 \text{ rpm}$$

Negative values indicate motor rotating in the reverse direction of rotation.

**.3 Status Word 2** It indicates other status of the inverter functions. Each bit represents a status.

| Bit                            | Value/Description  |
|--------------------------------|--|
| Bit 0<br>Self-tuning           | <b>0 = No:</b> inverter is not running the Self-tuning routine.<br><b>1 = Yes:</b> inverter is running the Self-tuning routine for estimating motor parameters |
| Bit 1<br>Not used              | Not used.  |
| Bit 2<br>Pre-Charge OK         | <b>0 = No:</b> pre-charge of the DC link capacitors not completed<br><b>1 = Yes:</b> pre-charge of the DC link capacitors completed                            |
| Bit 3<br>SF Reduction          | <b>0 = No:</b> output frequency reduction inactive<br><b>1 = Yes:</b> output frequency reduction active  |
| Bit 4<br>Not used              | Not used.  |
| Bit 5<br>Decel. Ramp           | <b>0 = No:</b> no deceleration<br><b>1 = Yes:</b> inverter decelerating  |
| Bit 6<br>Accel. Ramp           | <b>0 = No:</b> no acceleration<br><b>1 = Yes:</b> inverter accelerating  |
| Bit 7<br>Freeze Ramp           | <b>0 = No:</b> ramp in normal operation<br><b>1 = Yes:</b> the path of the ramp is frozen by some command source or internal function                          |
| Bit 8<br>Setpoint OK           | <b>0 = No:</b> motor speed has not reached the reference yet<br><b>1 = Yes:</b> motor speed has reached the reference  |
| Bit 9<br>DC Voltage Limitation | <b>0 = No:</b> DC link limitation or current limitation inactive<br><b>1 = Yes:</b> DC link limitation or current limitation active                            |
| Bit 10<br>Current Limitation   | <b>0 = No:</b> current limitation inactive<br><b>1 = Yes:</b> current limitation active  |
| Bit 11<br>Torque Limitation    | <b>0 = No:</b> torque limitation inactive<br><b>1 = Yes:</b> torque limitation active  |
| Bit 12<br>Ride-Through         | <b>0 = No:</b> Ride-through not running<br><b>1 = Yes:</b> running Ride-through  |
| Bit 13<br>Flying Start         | <b>0 = No:</b> Flying start not running<br><b>1 = Yes:</b> running Flying start  |
| Bit 14<br>DC Braking           | <b>0 = No:</b> DC breaking inactive<br><b>1 = Yes:</b> DC breaking active  |
| Bit 15<br>PWM pulses           | <b>0 = No:</b> PWM voltage pulses at the output disabled<br><b>1 = Yes:</b> PWM voltage pulses at the output enabled   |

**.4 Status Word 3** Indicates other states of the inverter functions. Each bit represents a state.

| Bit               | Value/Description  |
|-------------------|--|
| Bit 0<br>SD Card  | SD card detection is performed only during the inverter initialization, so the inverter does not detect SD card disconnection during operation.<br><b>0 = No:</b> SD card not connected<br><b>1 = Yes:</b> SD card connected |
| Bit 1<br>Not used | Not used.  |

## S5.2 Serial RS485

It allows viewing the status of the RS485 serial interface and the commands received by this interface.

### S5.2 Serial RS485

|                          |                      |
|--------------------------|----------------------|
| .1 Interface Status      | 0 ... 2              |
| .2 Control Word          | 0 ... 7 Bit          |
| .3 Speed Reference       | -200.00 ... 200.00 % |
| .5 Received Telegrams    | 0 ... 65535          |
| .6 Transmitted Telegrams | 0 ... 65535          |
| .7 Telegrams with Error  | 0 ... 65535          |
| .8 Reception Errors      | 0 ... 65535          |

**.1 Interface Status** It indicates the status of the RS485 serial interface.

| Indication        | Description  |
|-------------------|--|
| 0 = Inactive      | Not used.  |
| 1 = Active        | Serial interface active.   |
| 2 = Timeout Error | It indicates that the CFW900 did not receive valid telegrams for a time longer than the limit set. |

**.2 Control Word** It indicates the status of the control word via RS-485 serial interface. This parameter can only be changed via RS485 serial interface. For other sources, only read access is allowed.

For the commands written in this parameter to be executed, the inverter must be programmed to be commanded via Serial. This programming is done through menu C4.

Each bit of this word represents a command that can be executed on the inverter.

| Bit                     | Value/Description   |
|-------------------------|---|
| Bit 0<br>Enable Ramp    | <b>0 = No:</b> it stops the motor by deceleration ramp<br><b>1 = Yes:</b> the motor turns according to the acceleration ramp until reaching the speed reference value                               |
| Bit 1<br>General Enable | <b>0 = No:</b> it disables the inverter completely, interrupting the motor power supply<br><b>1 = Yes:</b> it enables the inverter completely, allowing the operation of the motor                  |
| Bit 2<br>Run Reverse    | <b>0 = No:</b> turn the motor in the direction of the reference signal (forward direction)<br><b>1 = Yes:</b> run the motor in the opposite direction of the reference signal (reverse direction)   |
| Bit 3<br>Enable JOG     | <b>0 = No:</b> it disables the JOG function<br><b>1 = Yes:</b> it enables the JOG function  |
| Bit 4<br>R1/R2 Mode     | <b>0 = R1:</b> it selects the Remote 1 command mode<br><b>1 = R2:</b> it selects the Remote 2 command mode  |
| Bit 5<br>2nd Ramp       | <b>0 = No:</b> 1st Ramp acceleration and deceleration according to parameters C6.1.1 and C6.1.2<br><b>1 = Yes:</b> 2nd Ramp acceleration and deceleration according to parameters C6.1.4 and C6.1.5 |
| Bit 6<br>No Quick Stop  | <b>0 = No:</b> it enables quick stop<br><b>1 = Yes:</b> it disables quick stop  |
| Bit 7<br>Fault Reset    | <b>0 = No:</b> not used<br><b>1 = Yes:</b> in the transition, if a fault is active, it resets the fault   |

**.3 Speed Reference** It indicates the speed reference sent via RS-485 Serial interface to the motor driven by the inverter in percentage of the maximum speed. This parameter can only be changed via RS485 serial interface. For other sources, only read access is allowed.

For the reference written in this parameter to be used, the inverter must be programmed to use the speed reference via Serial. This programming is done through menu C4.

- S5.2.3 = 0.00 % ⇒ speed reference = 0 rpm
- S5.2.3 = 100.00 % ⇒ speed reference = C4.3.1.1.2

Intermediate or higher speed values can be obtained by using this scale. For example, if the desired value for the reference is 900 rpm, considering C4.3.1.1.2 = 1800 rpm, it should be calculated:

100.00 % : 1800 rpm  
Reference % : 900 rpm

$$\text{Reference \%} = \frac{900 \times 100.00}{1800}$$

Reference \% = 50 %

Negative values can be used to reverse the direction of rotation of the motor. The direction of rotation of the motor, however, also depends on the value of the rotation direction command bit in S1.6.1:

- Bit Rotation Direction = 1 and S5.2.3 > 0: reference for the forward direction
- Bit Rotation Direction = 1 and S5.2.3 < 0: reference for the reverse direction
- Bit Rotation Direction = 0 and S5.2.3 > 0: reference for the reverse direction
- Bit Rotation Direction = 0 and S5.2.3 < 0: reference for the forward direction

**.5 Received Telegrams** It indicates the number of telegrams received.

**.6 Transmitted Telegrams** It indicates the number of telegrams transmitted.

**.7 Telegrams with Error** It indicates the number of telegrams received with errors (CRC, Checksum).

**.8 Reception Errors** It indicates the number of bytes received with errors.

The counters are cyclic, that is, when it reaches 65535, it returns to 0.

**NOTE!**

These counters start at 0 whenever the product is powered on. They also return to 0 whenever the maximum limit of the parameter is reached.

## 5 C CONFIGURATION

It allows changing the setting parameters of CFW900. Depending on the property of the parameter, it is possible to adjust its value according to the table below.

| Property | Description   |
|----------|---|
| Stopped  | Parameter can only be changed when the motor is stopped.  |
| Model    | Default value may change depending on the inverter model. |

**NOTE!**

Parameter options with the description "Reserved" are for WEG's exclusive use.

## C9 COMMUNICATIONS

It sets the CFW900 to exchange information via communication network.

### C9.2 I/O Data

It sets the cyclic data exchange area of the communication networks.

#### C9.2.1 Reading Data

##### C9.2.1.1 Word #1

C9.2.1.1 to C9.2.1.100

##### C9.2.1 Reading Data

##### C9.2.1.100 Word #100

|                    |            |                   |
|--------------------|------------|-------------------|
| <b>Range:</b>      | 0 ... 9999 | <b>Default:</b> 0 |
| <b>Properties:</b> | Stopped    |                   |

**Description:**

It selects the address (Net Id) of the parameter whose content should be provided in the reading area for the fieldbus interfaces (input: sent to the network master).

The size of the referenced parameter must be taken into account. If the data size is greater than 16 bits, the configuration parameter of the next programmable word must be set to the same address.

#### C9.2.2 Writing Data

It configures a set of 16-bit parameters to be written via communication network.

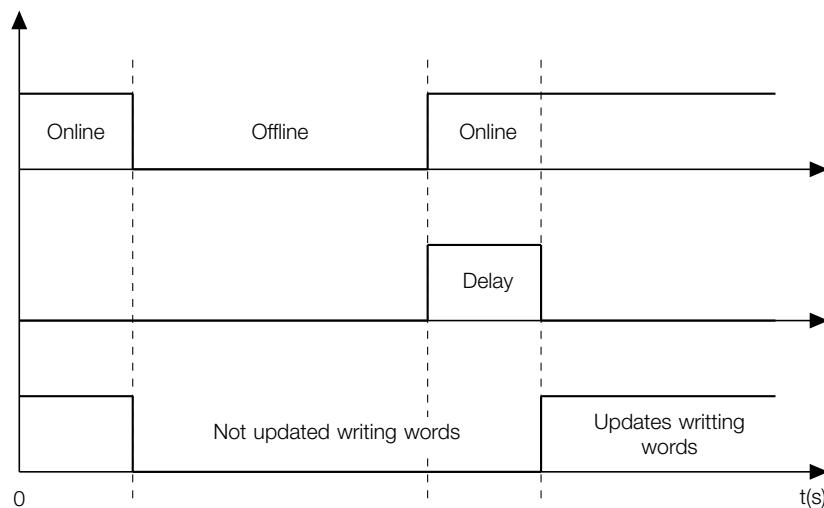

##### C9.2.2 Writing Data

##### C9.2.2.1 Update Delay

|                    |                 |                       |
|--------------------|-----------------|-----------------------|
| <b>Range:</b>      | 0.0 ... 999.0 s | <b>Default:</b> 0.0 s |
| <b>Properties:</b> |                 |                       |

**Description:**

Whenever there is a transition from offline (without cyclic data) to online (with cyclic writing data), the data received via communication network (writing words) is ignored during this programmed time, remaining in the status it was before the beginning of the reception.

*Figure 5.1: Delay in the update of the I/O words*

**C9.2.2 Writing Data****C9.2.2 Word #1**

C9.2.2 to C9.2.2.101

**C9.2.2 Writing Data****C9.2.2.101 Word #100**

|                    |            |                   |
|--------------------|------------|-------------------|
| <b>Range:</b>      | 0 ... 9999 | <b>Default:</b> 0 |
| <b>Properties:</b> | Stopped    |                   |

**Description:**

It selects the address (Net Id) of the parameter whose content should be provided in the writing area for the fieldbus interfaces (output: received from the network master).

The size of the referenced parameter must be taken into account. If the data size is greater than 16 bits, the configuration parameter of the next programmable word must be set to the same address.

**C9.3 Serial RS485**

Configuration for the RS485 communication interface and the protocols that use this interface.

**C9.3 Serial RS485****C9.3.1 Protocol**

|                    |         |                   |
|--------------------|---------|-------------------|
| <b>Range:</b>      | 0 ... 2 | <b>Default:</b> 2 |
| <b>Properties:</b> | Stopped |                   |

**Description:**

It select the desired protocol for the RS485 serial interface.

| Indication         | Description                       |
|--------------------|-----------------------------------|
| 0 ... 1 = Reserved | Not used.                         |
| 2 = Modbus RTU     | Slave Modbus RTU serial protocol. |

**C9.3 Serial RS485****C9.3.2 Address**

|                    |           |                   |
|--------------------|-----------|-------------------|
| <b>Range:</b>      | 1 ... 247 | <b>Default:</b> 1 |
| <b>Properties:</b> | Stopped   |                   |

**Description:**

It select the address used for the serial communication.

It is necessary that each device on the network has a different address from all the others.

**C9.3 Serial RS485****C9.3.3 Baud Rate**

|                    |         |                   |
|--------------------|---------|-------------------|
| <b>Range:</b>      | 0 ... 3 | <b>Default:</b> 1 |
| <b>Properties:</b> | Stopped |                   |

**Description:**

Select the desired value for the baud rate of the serial interface in bit per second. This rate must be the same for all devices connected to the network.

| Indication      | Description                    |
|-----------------|--------------------------------|
| 0 = 9600 bit/s  | Rate of 9600 bits per second.  |
| 1 = 19200 bit/s | Rate of 19200 bits per second. |
| 2 = 38400 bit/s | Rate of 38400 bits per second. |
| 3 = 57600 bit/s | Rate of 57600 bits per second. |

**C9.3 Serial RS485****C9.3.4 Bytes Config.**

|                    |         |                   |
|--------------------|---------|-------------------|
| <b>Range:</b>      | 0 ... 5 | <b>Default:</b> 1 |
| <b>Properties:</b> | Stopped |                   |

**Description:**

Select the settings for the number of data bits, parity and stop bits in the serial interface bytes. This setting must be identical for all the devices connected to the network.

| Indication         | Description                           |
|--------------------|---------------------------------------|
| 0 = 8-bits, no, 1  | 8 bits, no parity, 1 stop bit.        |
| 1 = 8-bits, even,1 | 8 bits, with even parity, 1 stop bit. |
| 2 = 8-bits, odd, 1 | 8 bits, with odd parity, 1 stop bit.  |
| 3 = 8-bits, no, 2  | 8 bits, no parity, 2 stop bit.        |
| 4 = 8-bits, even,2 | 8 bits, with even parity, 2 stop bit. |
| 5 = 8-bits, odd, 2 | 8 bits, with odd parity, 2 stop bit.  |

**C9.3 Serial RS485****C9.3.5 RS485 Timeout**

|                    |                 |                       |
|--------------------|-----------------|-----------------------|
| <b>Range:</b>      | 0.0 ... 999.0 s | <b>Default:</b> 0.0 s |
| <b>Properties:</b> | Stopped         |                       |

**Description:**

Maximum time without communication.

## 6 OPERATION IN THE MODBUS RTU NETWORK – SLAVE MODE

The CFW900 frequency inverter has the following characteristics when operated as a slave in Modbus RTU network:

- Network connection via RS485 serial interface.
- Address, communication rate and byte format defined by equipment parameters.
- It allows the CFW900 frequency inverter programming and control via the access to parameters.
- It allows accessing all the markers and data used in the ladder program of the CFW900 frequency inverter.

### NOTE!

- The RS485, USB and Ethernet interfaces, for using the same functions to access the data and programming of the equipment, must not be used simultaneously to perform program download or on-line monitoring functions of the CFW900 frequency inverter, because conflicts may occur during the simultaneous access to the data.

### 6.1 AVAILABLE FUNCTIONS

In the Modbus specification are defined the functions used to access different types of data. In the CFW900, in order to access those data the following services (or functions) have been made available:

*Table 6.1: Supported Modbus Functions*

| Code | Name                          | Description   |
|------|-------------------------------|---|
| 01   | Read Coils                    | Reading of bit blocks of the coil type                              |
| 02   | Read Discrete Inputs          | Reading of bit blocks of the discrete input type                    |
| 03   | Read Holding Registers        | Reading of register blocks of the holding register type             |
| 05   | Write Single Coil             | Writing in a single bit of the coil type                            |
| 06   | Write Single Register         | Writing in a single register of the holding type                    |
| 15   | Write Multiple Coils          | Writing in bit blocks of the coil type                              |
| 16   | Write Multiple Registers      | Writing in register blocks of the holding register type             |
| 22   | Mask Write Register           | Writing in holding register using mask                              |
| 23   | Read/Write Multiple registers | Reading and writing in register blocks of the holding register type |
| 43   | Read Device Identification    | Identification of the device model                                  |

### 6.2 MEMORY MAP

The frequency inverter CFW900 has different types of data accessible through the Modbus communication. These data are mapped at data addresses and access functions as described in the following items.

#### 6.2.1 Parameters

The CFW900 frequency inverter Modbus communication is based on the reading/writing of the equipment parameters. All parameters of the equipment are available as 16-bit holding registers. The data addressing is done with the offset equal to zero, which means that the parameter's network address (Net Id) corresponds to the register address.

It is necessary to know the device list of parameters to be able to operate the equipment. Thus, it is possible to identify what data are needed for the status monitoring and the control of the functions. The main parameters are:

Monitoring (reading):

- S5.1.1 (holding register address 680): Status and Commands Status Word 1.

Command (writing):

- S5.7.2 (holding register address 684): CAN/CANopen/DNet Control Word.
- S5.2.3 (holding register address 683): Serial RS485 Speed Reference.

Refer to the item 10 for a complete parameter list of the equipment.

#### NOTE!

- Depending on the master that is used, those registers are referenced starting from the base address 40000 or 4x. In this case, the address that must be programmed in the master for a parameter is the address showed in the table 10.1 added to the base address. Refer to the master documentation to find out how to access holding registers.
- It should be noted that read-only parameters can only be read from the equipment, while other parameters can be read and written through the network.
- Parameters that have the property *Stopped* are only changed when the motor is stopped.
- The data is transmitted as an integer value, without the indication of the decimal places. For the number of decimal places, see the item 10.

### 6.2.2 Memory Markers

Besides the parameters, other types of data as bit markers, word or float, can also be accessed using the Modbus protocol. Those markers are used mainly by the SoftPLC function, available for the CFW900. Refer to the SoftPLC documentation for the description of those markers, as well as for the addresses via Modbus.

## 6.3 DATA ACCESS

The Modbus protocol allows the access only by bits or by 16-bit registers.

To make it possible to write or read a block of more than 2 registers without an error return even if there is an invalid register in the selected range, the following definitions have been used:

- Reading registers that do not represent available parameters return the value zero when the requested number of registers is greater than 2. For requests with a quantity equal to 1 or 2 registers, error code 2 (Invalid data address) is returned.
- Write to registers that represent read-only or invalid parameters have no effect and do not return error when the requested number of registers is greater than 2. For requests with a quantity equal to 1 or 2 registers, error code 2 (Invalid data address) is returned.

Data types greater than 16 bits must be accessed as multiple registers. If the number of registers requested is not sufficient to access the full size of the data type, error code 2 (Invalid data address) is returned.

For example, the float data type take four bytes of memory. In the access by registers, it is necessary to read or write two registers in sequence (least significant value in the first register) so that the four bytes will be accessed.

The Modbus protocol defines that in order to transmit a 16-bit register, the most significant byte (MSB) must be transmitted first. Therefore, if four registers are read in a row, from the register with address 0, the content of each register will be transmitted the following way:

| 1 <sup>st</sup> Register – 0 | 2 <sup>nd</sup> Register – 1 | 3 <sup>rd</sup> Register – 2 | 4 <sup>th</sup> Register – 3 |
|------------------------------|------------------------------|------------------------------|------------------------------|
| W0 MSB                       | W0 LSB                       | W1 MSB                       | W1 LSB                       |

## 6.4 COMMUNICATION ERRORS

Communication errors may occur in the transmission of telegrams, as well as in the contents of the transmitted telegrams.

In the event of a successful reception, during the treatment of the telegram, the slave may detect problems and send an error message, indicating the kind of problem found:

*Table 6.2: Error codes for Modbus*

| Error Code | Description   |
|------------|---|
| 1          | Invalid function: the requested function is not implemented for the equipment.  |
| 2          | Invalid data address: the data address (register or bit) does not exist.  |
| 3          | Invalid data value: <ul style="list-style-type: none"><li>▪ Value out of the allowed range.</li><li>▪ Writing on data that cannot be changed (read only register or bit).</li></ul> |

### NOTE!

It is important that it be possible to identify at the client what type of error occurred, in order to be able to diagnose problems during the communication.

## 7 STARTUP GUIDE

The main steps to start up the CFW900 frequency inverter in Modbus TCP network are described below. These steps represent an example of use. Check out the specific chapters for details on the indicated steps.

### 7.1 INSTALLING THE ACCESSORY

1. Note the content of parameter S5.2.1. Check if the module was recognized. Detection is done automatically and does not require user intervention.
2. Connect the cables, considering the recommended instructions in network installation, as described in item 3:
  - Use shielded cable.
  - Properly ground network equipment.
  - Avoid laying communication cables next to power cables.

### 7.2 CONFIGURING THE EQUIPMENT

1. Follow the recommendations described in the user manual to program the device parameters related to the motor parameterization, desired functions for the I/O signals, etc.
2. Program the command sources as desired for the application in menu C4.
3. Configure communication parameters, such as address, baudrate, parity, etc. in C9.3.
4. Configure the timeout for the Modbus RTU communication in C9.3.5.
5. Program the desired action for the equipment in case of communication fault in C9.1.
6. Define which data will be read and written at frequency inverter CFW900, based on its parameter list. It is not necessary to define I/O words. The Modbus RTU protocol enables direct access to any device parameter, and does not distinguish between cyclic and acyclic data. Nevertheless, data exchange areas can be configured via menu C9.2 (see item ??). Among the main parameters that can be used to control the device, we can mention:
  - S5.1.1 Status and Commands Status Word 1 (read).
  - S5.2.2 Serial RS485 Control Word (write).
  - S5.2.3 Serial RS485 Speed Reference (write).

### 7.3 CONFIGURING THE MASTER

The way the network configuration is done depends greatly on the used master and the configuration tool. It is essential to know the tools used to perform this activity. In general, the following steps are necessary to perform the network configuration.

1. Configure the master to access the holding registers, based on the defined equipment parameters to read and write. The register address is based on the parameter's network address (Net Id), as shown in the item 10.
2. It is recommended that reading and writing are done in a cyclic manner, allowing detection of communication errors by timeout. The period of data update must be in accordance with the value programmed in parameter C9.3.5.

### 7.4 COMMUNICATION STATUS

Once the network is assembled and the master programmed, it is possible to use the LEDs and parameters of the equipment to identify some status related to the communication.

- Parameter S5.2.1 indicates the slave communication status.
- Parameters S5.2.5 and S5.2.6 indicate, respectively, the number of Modbus RTU telegrams received and transmitted by the slave.
- Parameters S5.2.7 and S5.2.8 indicate communication errors detected by the slave.

The master of the network must also supply information about the communication with the slave.

## 8 FAULTS AND ALARMS

| Fault/Alarm                              | Description  | Possible Causes  |
|--|--|--|
| A128:<br>Serial Communication<br>Timeout | <p>It indicates that the CFW900 stopped receiving telegrams on the serial interface for a period longer than the setting programmed in C9.3.5.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"><li>- Ensure that the master always sends telegrams to the equipment in a shorter time than that set in C9.3.5.</li><li>- It can be disabled by setting C9.3.5=0.0 s.</li></ul> | <ul style="list-style-type: none"><li>- Check network installation, broken cable or fault/poor contact on the connections with the network, and grounding.</li></ul> |
| F228:<br>Serial Communication<br>Timeout | <p>It indicates that the CFW900 stopped receiving telegrams on the serial interface for a period longer than the setting programmed in C9.3.5.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"><li>- Ensure that the master always sends telegrams to the equipment in a shorter time than that set in C9.3.5.</li><li>- It can be disabled by setting C9.3.5=0.0 s.</li></ul> | <ul style="list-style-type: none"><li>- Check network installation, broken cable or fault/poor contact on the connections with the network, and grounding.</li></ul> |
