

Quick Installation Guide

WEMOB-STATION HPC (480 kW POWER CABINET)

Electric Vehicle Charging Stations (EV)

18474869

Document: 10012992640 / 01

1 SAFETY INSTRUCTIONS

All safety procedures described in this Quick Installation Guide and in the installation and operation manual of the WEMOB-STATION HPC electric vehicle charging station must be followed. These procedures aim to protect the user from death, serious injury, and substantial property damage.

1.1 GENERAL INFORMATION

This Quick Installation Guide contains the basic information required to install the Power Cabinet of the WEMOB-STATION HPC electric vehicle charging station. Refer also to the quick installation guide for the Totem and the installation and operation manual of the WEMOB-STATION HPC electric vehicle charging station.

1.1 PRELIMINARY RECOMMENDATIONS

- Only personnel with appropriate qualifications and familiarity with the charging station and associated equipment should plan or perform installation, startup, operation, and maintenance of this equipment.
- These individuals must follow all safety instructions contained in this guide, the installation and operation manual, and/or as defined by local regulations.
- Failure to follow safety instructions may result in life-threatening risks and/or equipment damage.
- A damaged charging station must be taken out of service and repaired by the manufacturer or its authorized representative.
- No alterations or modifications to the charging station are permitted.
- Always disconnect the main power supply before touching any electrical component associated with the electric vehicle charging station.

- Be careful not to damage the circuit boards or components of the WEMOB-STATION HPC Power Cabinet.
- Electronic boards contain components that are sensitive to electrostatic discharge. Do not touch components or connectors directly.

- For the purposes of this guide, qualified personnel are those who have been trained to:
 1. Install, ground, power on, and operate the EV charging station in accordance with this guide, the user manual, and applicable safety regulations.
 2. Use personal protective equipment (PPE) according to established standards.
 3. Provide first aid services.
- If the Power Cabinet remains unused for an extended period, it is recommended to keep it powered on to avoid condensation inside the unit.

1.2 RECEIPT AND STORAGE

The Power Cabinet of the WEMOB-STATION HPC charging station is supplied packaged in a wooden crate with internal plastic lining. An external label on the package describes key product features such as model, WEG stock item, serial number, manufacturing date, etc.

Check that:

- The identification label matches the purchased model.
- No damage occurred during transport. If any issue is found, immediately contact the carrier.
- If the Power Cabinet is not installed immediately, keep it inside the closed packaging and store it in a clean, dry place with a temperature between -25 °C and +80 °C [-13 °F and +176 °F].

After receipt:

- Remove the plastic film to prevent moisture condensation.
- Do not store under direct sunlight, rain, extreme cold, excessive humidity, or salty air.
- Store in a clean, protected environment with air humidity not exceeding 80 %.
- If storage exceeds one year, additional dehumidification measures should be taken.
- Before use after prolonged storage, ensure the equipment is free from scratches, dirt, condensation, rust, or other damage.

- The performance and reliability of the WEMOB-STATION HPC Power Cabinet may be impaired if stored in conditions outside the aforementioned conditions.

1.3 OPENING THE PACKAGE

Use appropriate tools to unpack the WEMOB-STATION HPC Power Cabinet. Remove the plastic film manually or with a utility knife, being careful not to damage the product.

While opening the package, check if there are damages to the product. Do not install the Power Cabinet in case you suspect any damage.

Remove any particles from the package (plastic, wood, styrofoam, metal, nails, screws, nuts etc.) that may have remained in the Power Cabinet.

- Wear personal protective equipment (PPE).
- If any component shows signs of damage:
- Stop unpacking immediately.
- Contact the carrier and formally report the issue.
- Take photographs of the damaged parts and/or components.

2 OVERVIEW

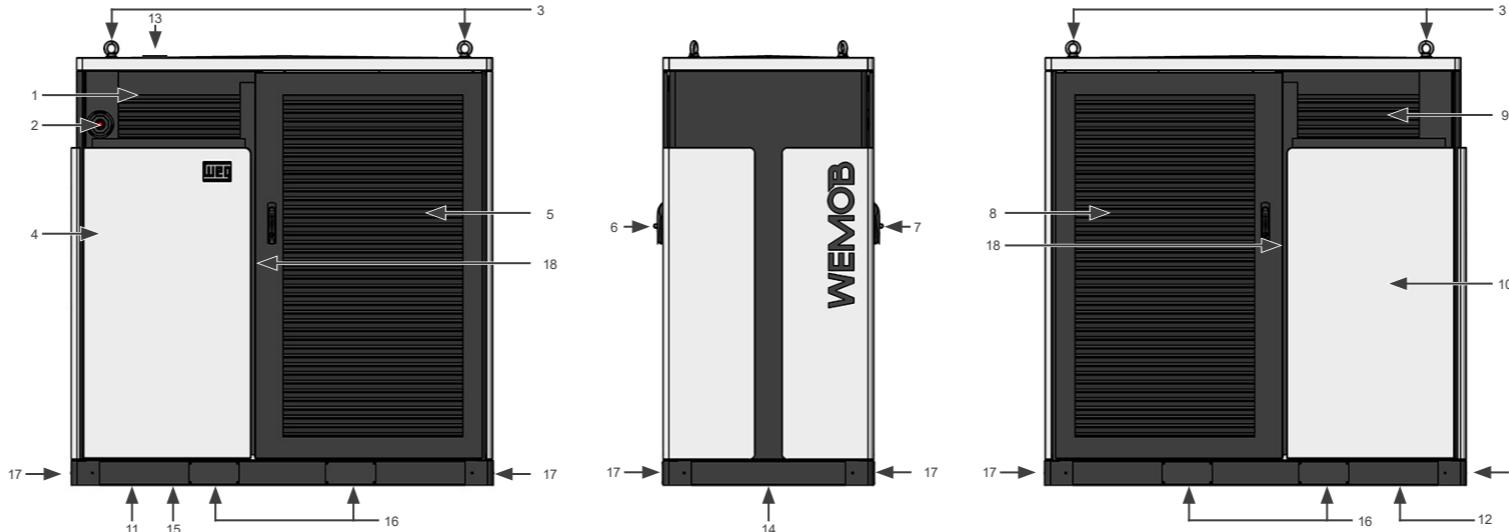

Figure 2.1: General overview of the WEMOB-STATION HPC Power Cabinet

Table 2.1: General overview of the WEMOB-STATION HPC Power Cabinet

1 – Front air outlet	7 – Front lock	13 – Wi-Fi/Cellular antenna
2 – Emergency button	8 – Rear air intake louver door (power modules)	14 – Power Cabinet metallic base
3 – Lifting points	9 – Rear air intake	15 – Wired internet input location
4 – Front door	10 – Rear door	16 – Forklift fork access points
5 – Front air outlet louver (power modules)	11 – Power cable entry location	17 – Fixing points
6 – Rear lock	12 – Output cable exit to Totems	18 – Internal lock

3 INSTALLING

The instructions and recommendations must be followed to ensure proper operation and the safety of people and equipment. The procedures are divided into:

- Mechanical Installation.
- Electrical Installation.

4 MECHANICAL INSTALLATION

The WEMOB-STATION HPC Power Cabinet is designed for indoor or outdoor use, floor-mounted. Some requirements must be ensured for proper protection at the installation site.

4.1 RECOMMENDED HANDLING PROCEDURES

It is recommended to remove the packaging only after placing the Power Cabinet in its final operating location. Before lifting or moving the unit, read the instructions below to understand the available mechanical connection points and fragile areas.

4.2 LIFTING

Ensure the lifting equipment is appropriate for the unit's geometry and mass.

Check the center of gravity and make sure the lifting supports are safe and suitable, with multiple coupling points. The lifting cables or chains must form an angle greater than 45° with the horizontal. Lift slowly and steadily. Make sure there are no obstacles along the path. If any deformation or damage is detected in the structure, abort the lifting and reposition the chains or cables as shown in Figure 4.1.

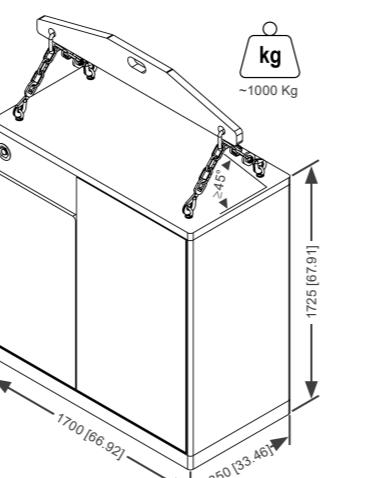

Figure 4.1: Recommended geometry, mass and lifting height for the Power Cabinet – mm [in]

4.3 HANDLING

If using a crane, hoist, or winch, make sure movements are slow and smooth to avoid excessive swinging or vibration.

If using pallet trucks, forklifts, rollers, or other transport equipment, distribute support points along the entire cabinet base, avoiding pressure on fragile areas. If the packaging has already been removed, ensure all cabinet doors are closed and latched, and handles are in the protected position.

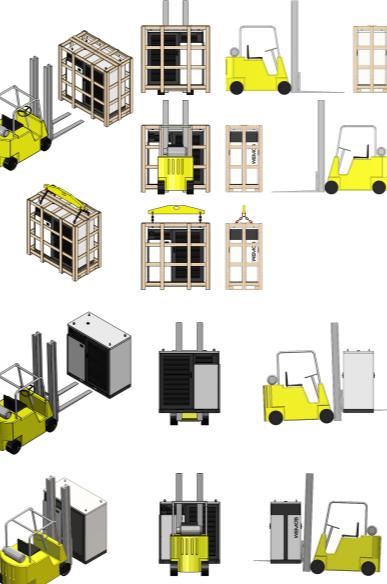

Figure 4.3: Procedure for moving with a forklift or hoist

- ATTENTION!
- Never use chains underneath the cabinet for lifting.
- Only trained and authorized personnel may operate the forklift. Do not make risky movements such as sharp turns, sudden accelerations, or abrupt stops; these may cause the unit to tip over, risking severe injury or death.

To move the cabinet without the wooden pallet, there are four (04) access points for forklift forks, two (02) on each side. To remove the metal covers, follow the steps below:

1. Locate the four (04) metal covers.
2. Remove the four (04) M4 Phillips screws securing the covers.
3. Remove the covers.
4. Insert the forklift forks until they exit the other side.
5. Carefully move the Power Cabinet to the final installation site.

After moving, reattach the metal covers.

- ATTENTION!
- Attach the chains or cables to all available lifting points.
- After positioning the Power Cabinet in its final location, remove the lifting eyes and replace them with the supplied M16 stainless steel screws, flat washers, and O-ring to ensure sealing and protection rating.

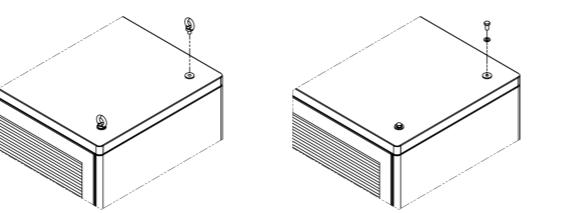

Figure 4.2: Detail of changing the lifting eye for screw, washer and O'ring

4.4 ENVIRONMENT CONDITIONS

The following criteria must be considered when selecting an appropriate installation location:

- The final installation location must allow free access for handling and transport using a forklift or hoist.
- Ensure the floor condition is suitable for safe anchoring.
- The mounting surface must be stable and strong enough to support the Power Cabinet's weight.
- Do not install on inclined surfaces.
- Avoid unstable, movable, or uneven surfaces.
- Do not install under suspended objects or furniture that could fall and damage the unit.
- The Power Cabinet requires high current. Consider installing it near as possible to the main distribution panel.
- Ensure the distance between the Power Cabinet and the Totems is less than 60 meters (60 m) [196.85 ft].
- A physical barrier is recommended to prevent vehicle collisions with the cabinet.

Permitted environmental operating conditions:

- Temperature: -25 °C to +40 °C [-13 °F to +104 °F] - rated conditions. From +41 °C to +50 °C [+105.8 °F to +122 °F] - with derating.
- Relative humidity: 5 % to 95 %, non-condensing.
- Install in a well-ventilated environment.
- Maximum altitude: 2000 meters (2000 m) [6561 ft] above sea level (nominal conditions). For applications at higher altitudes, contact WEG.

To ensure proper operation and extend service life:

- Avoid direct exposure to sunlight, rain, snow, extreme cold, excessive humidity, sea air, lightning, or adverse weather.
- In harsh environments, provide extra protection, install the unit indoors, or add a protective canopy.
- Do not install near heat-emitting devices.
- Respect minimum spacing from walls or other equipment.
- Do not spill water or liquids into the equipment.
- Avoid exposure to flammable, explosive, or corrosive gases, vapors, or liquids.
- Do not expose to excessive vibration.
- Avoid dust, metallic particles, or suspended oil.
- Do not expose to high-pressure water jets (pressure washer, garden hose, etc.).

4.5 POSITIONING AND FIXING THE POWER CABINET

The Power Cabinet must be installed on a smooth concrete surface with a minimum compressive strength (FCK) of 25 MPa and properly leveled on both horizontal (02) axes, with a maximum deviation of 2 mm/m to avoid mechanical instability, door misalignment, etc. Provide a slight slope for rainwater drainage.

A minimum clearance of 1 meter (1 m) [3.28 ft] at the front, 1.6 meters (1.6 m) [5.24 ft] at the rear, and 0.7 meters (0.7 m) [2.29 ft] on the sides of the Power Cabinet must be provided to ensure adequate airflow and heat dissipation, as well as user circulation. It is recommended to install a physical barrier to prevent collisions between vehicles and the Power Cabinet.

- ATTENTION!
- The final operating position of the Power Cabinet must allow heat to radiate from all of its surfaces and ensure proper ventilation flow for its operation.
- To prevent overheating, ventilation openings must not be obstructed.
- The hot air exhaust from the Power Cabinet must not be directed toward people, animals, or plants.

The front, side, and rear areas of the Power Cabinet must not be obstructed, as they allow the necessary ventilation flow for heat dissipation from all surfaces. These clearances also ensure full door opening, access to internal components for maintenance or installation, and/or handling of power and control cables.

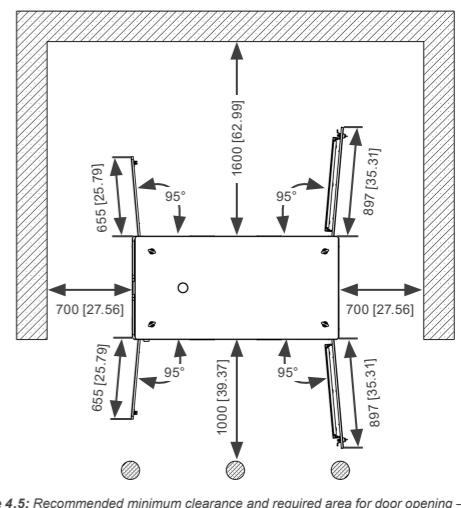

Figure 4.5: Recommended minimum clearance and required area for door opening – mm [in]

Conduits for routing wires and electrical cables must be provided at the bottom of the concrete base. Applicable local electrical installation standards must also be followed.

- One conduit for 3-phase AC power input, minimum 6" (160 mm [6.30 in]).
- One conduit for each DC output to the Totem, minimum 3" (85 mm [3.35 in]).
- One conduit for each AC + PE output to the Totem, minimum 1½" (50 mm [1.97 in]).
- One conduit for each Ethernet cable to the Totem, minimum ¾" (25 mm [0.98 in]) must be separate from power conduits.

Excessive bends in the conduits may hinder the routing of wires and electrical cables. Ensure that the distance between the Power Cabinet and the Totems is less than 60 meters (60 m) [196.85 ft]. If the distance exceeds 15 meters (15 m) [49.21 ft], or if there are more than three (03) consecutive bends, junction boxes must be installed along the route.

If the WEMOB-STATION HPC is connected to the internet via a wired RJ45 connection, a separate conduit (minimum 3/4") must be provided, independent from the main power supply, to prevent electromagnetic interference.

To secure the base, four (04) anchor bolts (3/8" x 3-3/4") supplied with the product must be used.

The mounting points are shown in Figure 4.6. The highlighted area indicates the position of the power supply, interconnection, and wired Ethernet cable conduits.

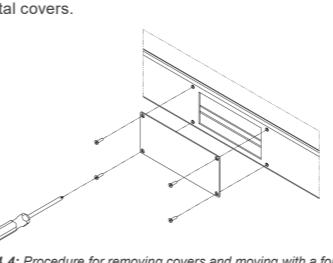

Figure 4.4: Procedure for removing covers and moving with a forklift

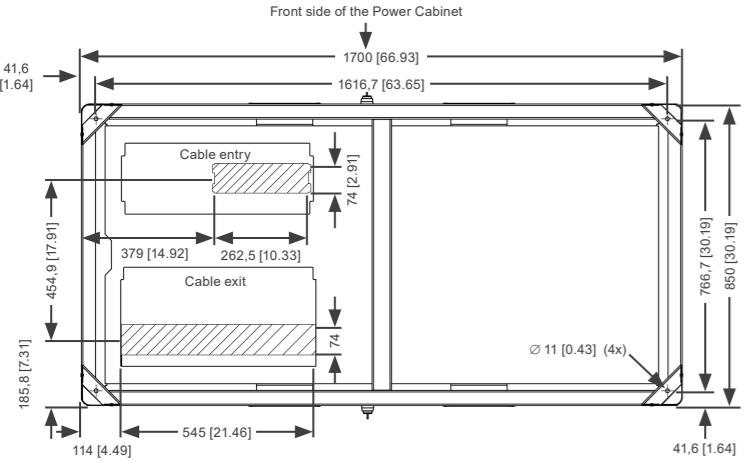

Figure 4.6: Mounting and cable routing dimensions for the Power Cabinet – mm [in]

The Power Cabinet must be carefully lowered using lifting equipment or a forklift. Ensure proper alignment between the holes in the base of the Power Cabinet and the mounting points on the concrete base. If the power, DC, or Ethernet cables have already been routed through the conduits, take care not to damage them during the installation of the Power Cabinet.

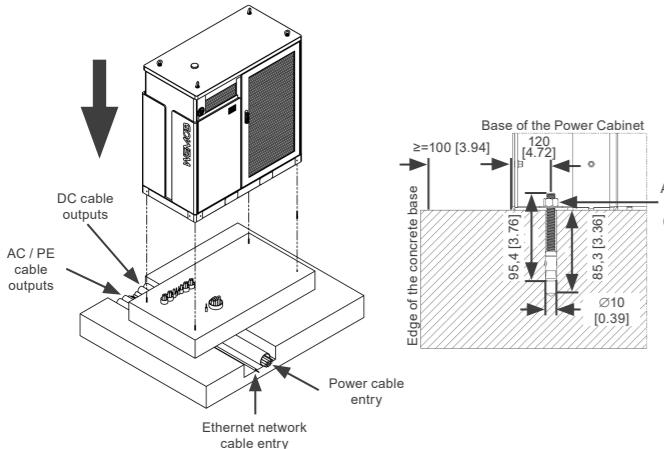

Figure 4.7: Mounting point details – mm [in]

4.6 OPENING AND CLOSING THE DOORS

To access the power circuit breaker and the output terminals for connection to the Charging Posts, the front and rear doors of the Power Cabinet must be opened.

The doors open and close via a tubular lock, which is only accessible from the inside. To reach this lock, the louvered doors must be opened using the retractable "lift and turn" handles.

To open the Power Cabinet door, follow the instructions below:

1. Insert the key into the cylinder lock of the louvered door and turn the key to unlock. If a padlock is being used for additional security, remove the padlock.
2. Pull the handle upwards.
3. Turn the handle clockwise.
4. Open the louvered door.

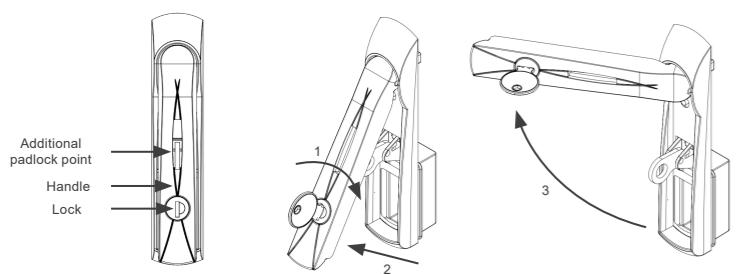

Figure 4.8: Instructions for opening the louvered door of the Power Cabinet

5. Insert the special tubular key into the security lock cylinder located on the internal structure of the Power Cabinet.

6. Turn the key clockwise.

7. Open the door.

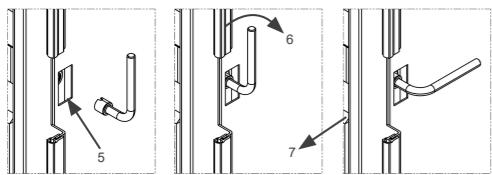

Figure 4.9: Instructions for opening the Power Cabinet door

To close, simply follow the steps in reverse order.

5 ELECTRICAL INSTALLATION

The following information is intended to serve as a guide for proper installation. Applicable local electrical installation standards must also be followed.

- The WEMOB-STATION HPC Power Cabinet requires high current and, therefore, high power for operation. Ensure that the electrical utility company can meet the demand requirements.
- Protections and installations must comply with national, state, and local electrical standards.
- Ensure the power supply is disconnected before beginning any electrical connections.
- The supply voltage must be compatible with the Power Cabinet's rated input voltage.
- The Power Cabinet must be connected to a protective earth (PE).
- The grounding resistance must be less than 100 Ω and below the maximum value defined by applicable electrical codes.

- If flexible cables are used for power, grounding, or interconnection, use appropriate terminals at cable ends.
- All electrical connections must be tightly secured to prevent arcing, overheating, or voltage drop.
- Use copper conductors only.
- Ensure all components are properly and continuously grounded during installation and use.
- Connect the PE (grounding conductor) before any other conductors.
- Do not share grounding wiring with other high-current equipment (e.g., welding machines, high-power motors, etc.).

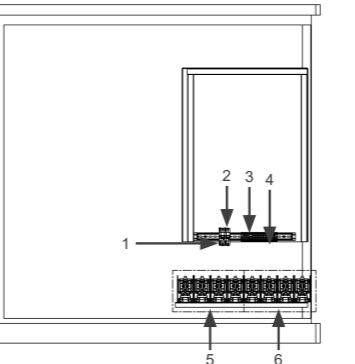

Figure 5.2: Supply voltage adjustment

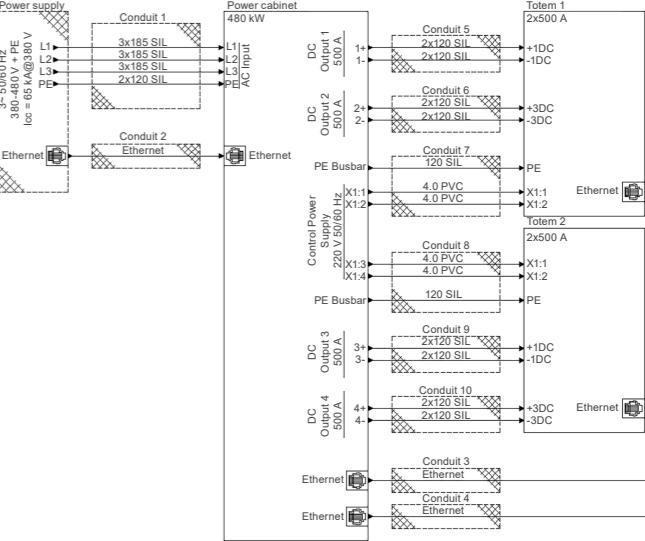

Figure 5.4: Wiring Diagram: Power Supply, Power Cabinet, and Totems

5.1 (AC) POWER SUPPLY CONNECTION

- Check the identification label to confirm the operating voltage range of the Power Cabinet.
- Connect the transformer primary (T1) according to the supply voltage.
- The Power Cabinet includes an internal molded-case circuit breaker ("Q1") for overload and short-circuit protection. To access Q1 and other components, remove the protective cover.

Connect the AC supply directly to the input terminals of circuit breaker Q1 (phases L1, L2, L3) and the grounding bar (PE).

Recommended copper conductor sizes and maximum current:

Model (Cabinet Power)	Max Input Current			Min Phase Conductor (L1-L2-L3) M12 Connection	Min Ground Conductor (PE) M12 Connection	
	380 V	440 V	460 V	480 V		
480 kW	803 A	694 A	663 A	636 A	3x165 mm ² (per phase)	2x120 mm ²

- The specified conductor gauges are based on a supply voltage of 380 V. A detailed wiring diagram is shown in Figure 5.4.
- The minimum conductor sizes are specified considering silicone rubber insulation rated at +200 °C [+392 °F], 1 kV, copper conductors, a maximum conductor operating temperature of +70 °C [+158 °F], reference method B1, and an ambient temperature of +40 °C [+104 °F].
- Each input busbar has two (02) M12 holes. Each M12 hole allows the connection of up to two (02) terminals one on the front and one on the back of the busbar.
- The recommended tightening torque for the M12 lug terminal screws is 84 Nm.

The appropriate conductor gauge for the AC power supply cable depends on the power rating and the distance between the distribution panel and the Power Cabinet. Single-core or multiple-core cables may be used to meet the required power capacity. Be sure to consider possible current-carrying capacity correction factors due to installation method, temperature, distance, and voltage drop. Under certain conditions, this may require an increase in the cable cross-sectional area.

Connections to the input busbars of circuit breaker "Q1" must be made using ring terminals, either pre-insulated or compression type.

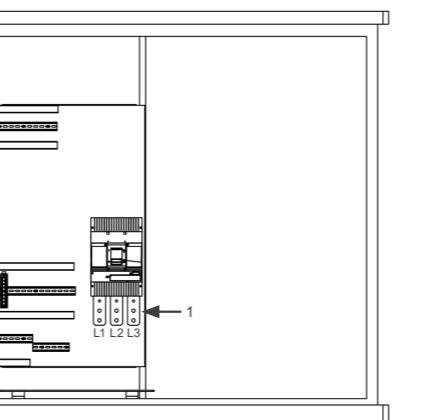

Figure 5.1: Power cable connections Phases (L1-L2-L3) and grounding (PE)

5. Insert the special tubular key into the security lock cylinder located on the internal structure of the Power Cabinet.

6. Turn the key clockwise.

7. Open the door.

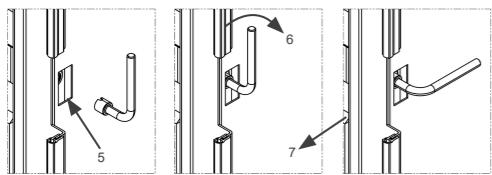

Figure 4.9: Instructions for opening the Power Cabinet door

5.1.1 Selection of Nominal Supply Voltage

The Totems, auxiliary circuits, and control circuits are powered by an internal transformer. It is necessary to select the nominal voltage of the supply network 380, 440, 460, or 480 VAC at terminal block set TAG: XV.

To make this adjustment, follow the instructions below:

1. Open the rear louvered door to access the back panel.
2. Remove the protective cover plate.
3. Locate the XV terminal block set at the bottom of the Power Cabinet (Figure 5.2).
4. Using a 4 mm [0.16 in] screwdriver, remove the three (03) cables from terminals XV:R/S/T and reposition them to the R/S/T terminals marked 380, 440, 460, or 480 V, according to the desired supply voltage.

To close, simply follow the steps in reverse order.

5.2 TOTEM INTERCONNECTION TO THE POWER CABINET

- Ensure that the distance between the Power Cabinet and the Totems is less than 60 m.

5.2.1 Direct Current (DC) Power Supply Cables

Connections to the terminals of the DC interconnection cables must be made on the busbars using ring terminals, either pre-insulated or compression type, as shown in Figure 5.2, items 5 and 6. The recommended tightening torque for the ring terminal screws is 84 Nm.

The direct current (DC) outputs are numbered and grouped into pairs of positive (+) and negative (-) polarity for each charging cable. For example: DC output 1 (+1/−), charging cable 1 of Totem 1; DC output 2 (+2/−), charging cable 2 of Totem 1.

- It is necessary to connect the direct current (DC) cables observing the polarity of the terminals (+/-) according to the identification plate located on the Power Cabinet and the Totems.
- Reversing the DC cable connections between output groups or polarities may cause damage or malfunction of the product.
- The grounding of the Totems must be done exclusively through the Power Cabinet, allowing the use of a single grounding cable for both Totems, provided it is sized for the Totem farthest from the Power Cabinet.

Table 5.1: Minimum Recommendation for DC and PE Conductors

Totem Model (Charging Current)	Min DC+ / DC- Conductor (M12)	Min Ground Conductor (PE, M12)
375 A (500 peak)	2x120 mm ² (per pole)	120 mm ²

- The minimum conductor sizes specified consider silicone rubber insulation rated at +200 °C [+392 °F], 1 kV, copper conductors, a maximum conductor operating temperature of +70 °C [+158 °F], reference method B1, and an ambient temperature of +40 °C [+104 °F].
- Each M12 hole allows the connection of up to two (02) terminals one on the front and one on the back of the busbar.
- The recommended tightening torque for the M12 screws of the ring terminals is 84 Nm.

The appropriate gauge of the DC interconnection conductors depends on the distance from the Totem to the Power Cabinet. Single or double cables may be used to meet the required power capacity. Please consider possible current-carrying capacity correction factors due to installation method, temperature, distance, and voltage drop. Under certain circumstances, this may require increasing the cable cross-sectional area.

5.2.2 AC Auxiliary Power Supply Cables

The Power Cabinet has protection circuit breakers (16 A) Q4 and Q5, dedicated exclusively to the alternating current (AC) supply for the Totems. The Totems are powered through terminals X1, X1:1, and X1:2 for Totem 1, and X1:3 and X1:4 for Totem 2. The output voltage is fixed at 220 VAC, 50/60 Hz.

The appropriate gauge for the AC interconnection conductors supplying the Totem should be at least 4 mm². Please consider possible current-carrying capacity correction factors due to installation method, temperature, distance, and voltage drop. Under certain circumstances, this may require increasing the cable cross-sectional area.

Table 5.2: AC Connection Terminal Characteristics

Terminal X1	Phase/Neutral	
	Solid wire	Flexible cable
Connection Capacity	1.5 ... 16 mm ²	1.5 ... 10 mm ²
AWG conductor	16 ... 6	12 mm
Cable stripping		12 mm
Tightening torque	1.2 to 1.8 Nm	

- The AC supply to the Totems must be made through the X1 terminals of the Power Cabinet; direct connection to the electrical grid is not permitted.
- Each Totem must be connected to a separate AC output from the Power Cabinet; using a single AC output to supply more than one Totem is not allowed.

5.2.3 Ethernet Communication Cable

The Ethernet cable connection from the Power Cabinet to the Totem(s) is made through the Ethernet switch SW located on the upper side of the Power Cabinet, accessible via the front door, as shown in Figure 5.1. The RJ45 connector on the switch complies with the Fast Ethernet 100BASE-TX standard, using two pairs of cables for data transmission and reception. Route the RJ45 Ethernet cable through the conduits at the base of the Power Cabinet to the corresponding RJ45 port on the switch, see Figure 5.3. Use standard Ethernet cable, 100BASE-TX (Fast Ethernet), CAT 5e or higher, with a maximum length of 100 meters (100 m) [328.08 ft]. To avoid communication interference, power cables should be kept as far away as possible from the Ethernet communication cable.

- NOTE!**
Daisy chaining is not allowed.

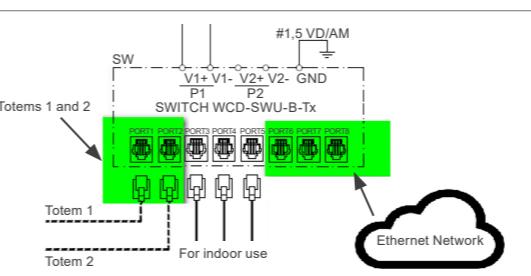

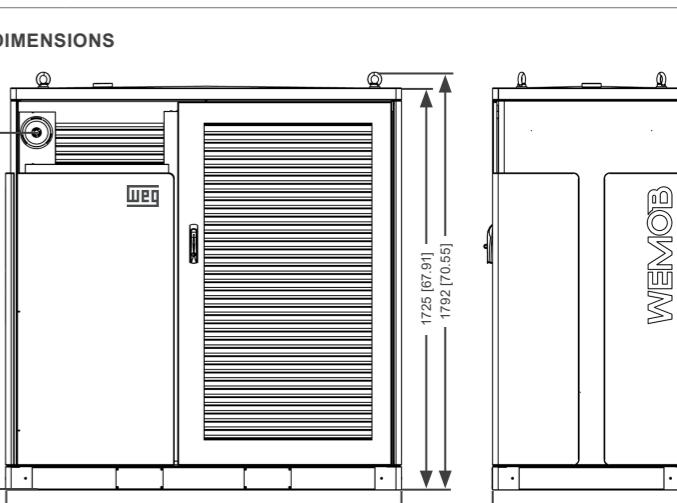

Figure 5.3: Ethernet Cable Wiring Diagram for Totems and External Network

Scan the QR Code below for more information:

User Manual

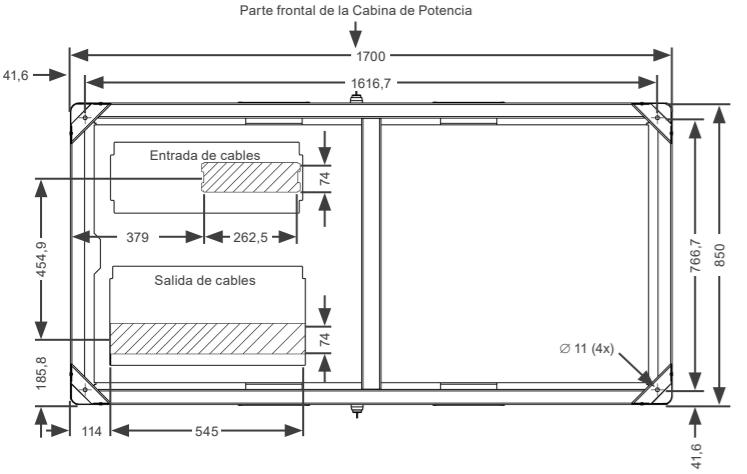

Figura 4.6: Dimensiones para la fijación y paso de cables de la Cabina de Potencia - mm

La Cabina de Potencia debe ser cuidadosamente bajada, utilizando equipo de izaje o montacargas. Asegúrese de la alineación entre los agujeros de la base de la Cabina de Potencia y los puntos de fijación de la base de concreto. Si los cables de alimentación, CC o red Ethernet ya han sido pasados por los conductos, tenga cuidado de no dañarlos durante la fijación de la Cabina de Potencia.

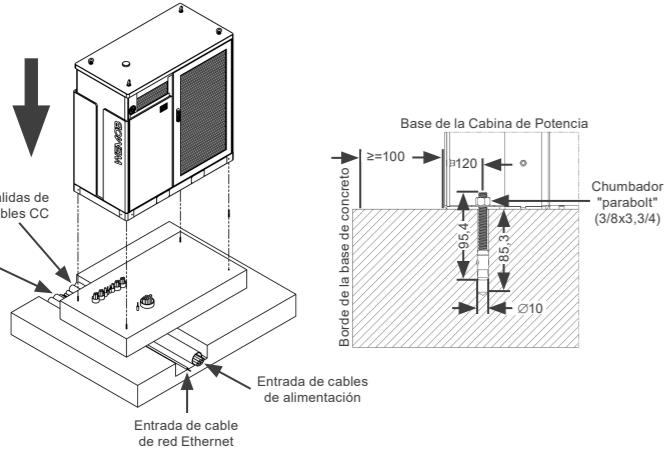

Figura 4.7: Detalles de los puntos de fijación - mm

4.6 APERTURA Y CIERRE DE LAS PUERTAS

Para tener acceso al interruptor de alimentación y a los bornes de salida para la conexión con los Tótems, es necesario abrir las puertas frontal y trasera de la Cabina de Potencia.

La apertura y cierre de las puertas se realiza mediante una cerradura tipo tubular, accesible únicamente desde el lado interno. Para acceder a ella, es necesario abrir las puertas persiana, utilizando las manijas escamoteables del tipo "levantar y girar".

Para abrir la puerta de la Cabina de Potencia, siga las instrucciones a continuación:

1. Inserte la llave en el cilindro de la cerradura de la puerta persiana y gire la llave para desbloquear. Si se está usando un candado para protección adicional, retire el candado.
2. Tire de la manija hacia arriba.
3. Gire la manija en sentido horario.
4. Abra la puerta persiana.

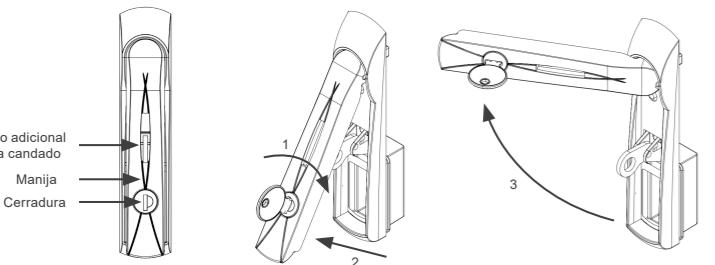

Figura 4.8: Instrucciones para la apertura de la puerta persiana de la Cabina de Potencia

5. Inserte la llave tubular especial en el cilindro de la cerradura de seguridad, ubicada junto a la estructura interna de la Cabina de Potencia.

6. Gire la llave en sentido horario.

7. Abra la puerta.

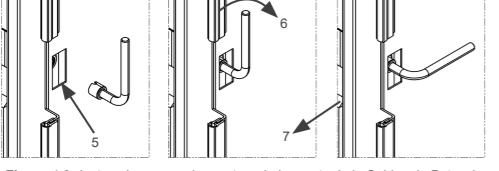

Figura 4.9: Instrucciones para la apertura de la puerta de la Cabina de Potencia

Para cerrar, simplemente siga el orden inverso.

5 INSTALACIÓN ELÉCTRICA

La siguiente información tiene como objetivo servir de guía para lograr una instalación correcta. Siga también las normas de instalaciones eléctricas aplicables en su localidad.

¡PELIGRO!

- La Cabina de Potencia de la estación de recarga WEMOB-STATION HPC requiere alta corriente y, en consecuencia, alta potencia para su funcionamiento. Asegúrese de que los requisitos de demanda sean cumplidos por la empresa suministradora de energía eléctrica.
- Las protecciones e instalaciones deben cumplir con las normas nacionales, estatales y locales de instalaciones eléctricas.
- Asegúrese de que la red de alimentación esté desconectada antes de iniciar las conexiones.
- La tensión de la red de alimentación debe ser compatible con el rango de tensión de la Cabina de Potencia WEMOB-STATION HPC.
- La Cabina de Potencia debe estar obligatoriamente conectada a una toma de tierra de protección (PE).
- La resistencia de puesta a tierra debe ser menor a 100Ω y inferior al valor máximo definido por las normas de instalación eléctrica aplicables.

¡ATENCIÓN!

- Cuando se utilicen cables flexibles para las conexiones de alimentación, puesta a tierra e interconexión, es necesario utilizar terminales adecuados en los extremos de los cables.
- Todas las conexiones eléctricas deben estar firmemente apretadas para evitar el riesgo de chispas, calentamiento excesivo o caída de tensión en los circuitos.
- Se recomienda la utilización de conductores de cobre.
- Asegúrese de que, durante la instalación y el uso, los componentes de la Cabina de Potencia estén conectados de forma constante y adecuada a la toma de tierra de protección (PE).
- Conecte primero el conductor PE antes de continuar con el montaje de los demás conductores.
- No comparta el cableado de puesta a tierra con otros equipos que operen con altas corrientes (como por ejemplo: máquinas de soldadura, motores de alta potencia, entre otros).

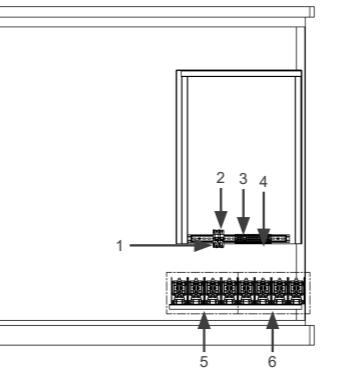

Figura 5.2: Ajuste de la tensión de la red de alimentación

5.2 INTERCONEXIÓN DEL TÓTEM A LA CABINA DE POTENCIA

¡ATENCIÓN!

Asegúrese de que la distancia entre la Cabina de Potencia y los Tótems sea inferior a 60 m.

5.2.1 Cables de Alimentación Corriente Continua (CC)

Las conexiones en los terminales de los cables de interconexión CC deben realizarse en las barras, utilizando terminal tipo ojo, preaislado o de compresión, según la Figura 5.2, ítems 5 y 6. El torque recomendado para apretar los tornillos de los terminales tipo ojo es de 84 Nm.

Las salidas de corriente continua (CC) están numeradas y separadas en grupos, pares de polaridad positiva (+) y negativa (-) para cada cable de recarga. Ejemplo: salida CC 1 (1+/-), cable de recarga 1 del Tótem 1, salida CC 2 (2+/-), cable de recarga 2 del Tótem 1.

¡ATENCIÓN!

- Es necesario realizar la conexión de los cables de corriente continua (CC) observando la polaridad de los terminales (+/-) de acuerdo con la placa de identificación presente en la Cabina de Potencia y en los Tótems.
- La inversión de las conexiones de los cables CC entre grupos de salidas o polaridades puede resultar en daños o mal funcionamiento del producto.
- La puesta a tierra de los Tótems debe realizarse únicamente a través de la Cabina de Potencia, permitiéndose el uso de un solo cable de tierra para ambos Tótems, siempre que esté dimensionado para el Tótem más alejado de la Cabina de Potencia.

Tabla 5.1: Recomendación mínima de los conductores y corriente máxima de entrada

Modelo (Potencia de la Cabina)	Corriente Máxima de Entrada				Conductor Mínimo Fases (L1 – L2 – L3) Conexión M12	Conductor Mínimo Tierra (PE) Conexión M12
	380 V	440 V	460 V	480 V		
480 kW	803 A	694 A	663 A	636 A	3x185 mm ² (Por fase)	2x120 mm ²

¡NOTA!

- Los calibres de los conductores especificados consideran una tensión de alimentación de 380 V. Un esquema detallado de conexión se presenta en la Figura 5.4.
- Los conductores mínimos indicados consideran aislamiento en caucho de silicona a +200 °C, 1 kV, en cobre, temperatura máxima de trabajo en el conductor de +70 °C, método de referencia B1 y temperatura ambiente de +40 °C.
- Cada barra de entrada posee dos (02) orificios M12; cada orificio M12 permite la conexión de hasta dos (02) terminales, uno por el frente y otro por detrás de la barra.
- El torque recomendado para apretar los tornillos M12 de los terminales tipo ojo es de 84 Nm.

El calibre adecuado de los conductores del cable de alimentación CA depende de la potencia y de la distancia desde el tablero de distribución hasta la Cabina de Potencia. Se pueden usar cables únicos o múltiples cables para atender la potencia necesaria. Observe posibles factores de corrección de la capacidad de corriente de los cables debido a la forma de instalación, temperatura, distancia y caída de tensión. Bajo ciertas circunstancias, esto puede llevar al aumento de la sección transversal del cable.

Las conexiones en las barras de entrada del interruptor "Q1" deben hacerse utilizando terminal tipo ojo, preaislado o de compresión.

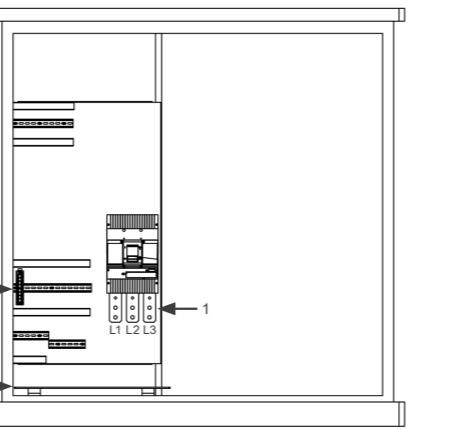

Figura 5.1: Conexiones de los cables de alimentación - Fases (L1-L2-L3) y puesta a tierra (PE)

5.1.1 Selección de la Tensión Nominal de Alimentación

Los Tótems, los circuitos auxiliares y los circuitos de mando se alimentan a partir de un transformador interno. Es necesario seleccionar cuál es la tensión nominal de la red de alimentación, 380, 440, 460 o 480 VCA, en el conjunto de bornes TAG: XV.

Para realizar este ajuste, siga las siguientes instrucciones:

1. Abra la puerta persiana trasera para tener acceso a la puerta trasera.
2. Retire la chapa de protección.
3. Localice el conjunto de bornes XV en la parte inferior de la Cabina de Potencia (Figura 5.2).
4. Usando un destornillador de 4 mm, retire los tres (03) cables de los bornes XV:R/S/T y reposicíonelos en los bornes R/S/T: 380, 440, 460 o 480 V, de acuerdo con la tensión de alimentación deseada.

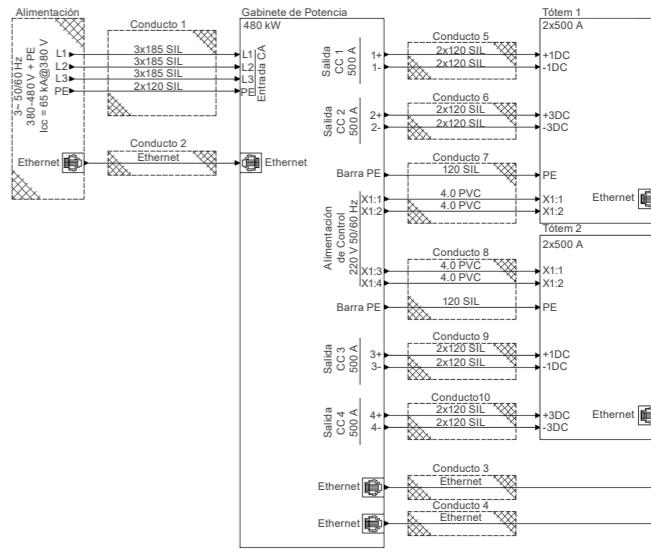

Figura 5.4: Esquema de conexión: alimentación, Cabina de Potencia y Tótems

5.3 DISPOSITIVO DE PROTECCIÓN

¡ATENCIÓN!

La Cabina de Potencia WEMOB-STATION HPC debe ser conectada a un interruptor automático de protección trifásico y a un interruptor diferencial residual (RCD o DR) con sensibilidad de 30 mA (CA) tipo A, exclusivo para el circuito de alimentación de la Cabina de Potencia.

Determine la corriente nominal de trabajo del interruptor automático aguas arriba de la Cabina de Potencia WEMOB-STATION HPC de acuerdo con los datos proporcionados por el fabricante, la corriente máxima de entrada de la Cabina de Potencia, los niveles de cortocircuito de la instalación y de la estación, la sección y la longitud de los cables de alimentación. También considere el factor de reducción de la corriente nominal del interruptor automático en función de la temperatura ambiente en que está instalado (en el tablero de distribución), además de la selectividad de las protecciones.

5.4 PREPARACIÓN PARA LA ENERGIZACIÓN

Antes de energizar la Cabina de Potencia WEMOB-STATION HPC, verifique que:

- Todas las conexiones de potencia (CA y CC), puesta a tierra y alimentación de los Tótems están correctas y firmes.
- La resistencia entre la tierra (PE) de la Cabina de Potencia y la tierra (PE) del panel de baja tensión cumple con las normas locales.
- Se han retirado del interior de la Cabina de Potencia todas las herramientas, restos de materiales utilizados en la instalación u objetos extraños que no forman parte del producto.
- Verifique si existe humedad en la Cabina de Potencia. También retire manualmente pequeñas cantidades de agua condensada antes de poner en funcionamiento. Tome las medidas adecuadas para el secado.
- Con la ayuda de un voltímetro (CA), compruebe los valores de las tensiones de línea de la alimentación de la Cabina de Potencia. Las tensiones entre los terminales L1, L2 y L3 del interruptor Q1 deben estar dentro del rango permitido de operación de la estación (según indicado en la etiqueta del producto).
- Verifique si la tensión seleccionada en el transformador T1 en el ítem 5.1.1 SELECCIÓN DE LA TENSIÓN NOMINAL DE ALIMENTACIÓN está de acuerdo con el valor de tensión CA medido.

¡NOTA!

Después de la puesta en funcionamiento, no apague la alimentación de corriente CA durante un período muy largo. La Cabina de Potencia cuenta con un sistema de calefacción que evita la formación de agua condensada en su interior.

6 DIMENSIONES

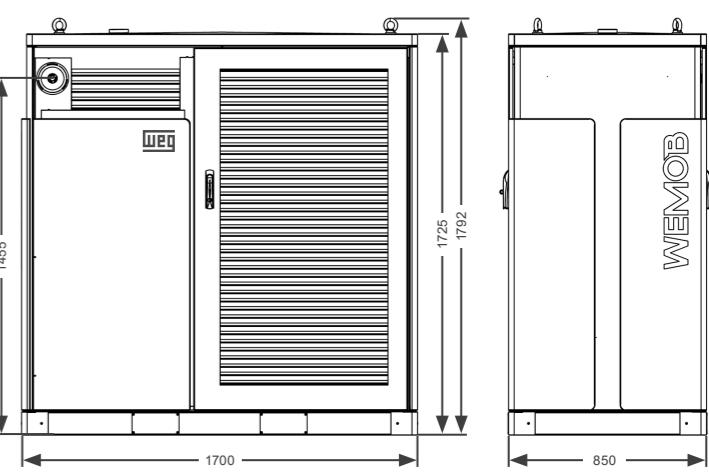

Figura 6.1: Dimensiones de la Cabina de Potencia - mm

Manual del Usuario

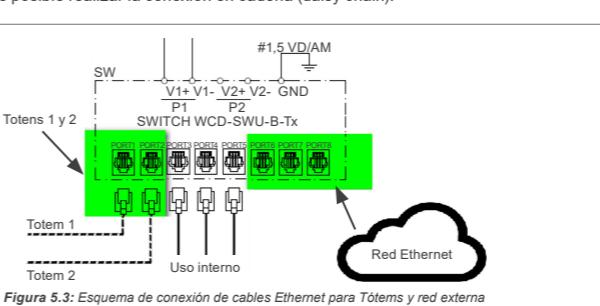

Figura 5.3: Esquema de conexión de cables Ethernet para Tótems y red externa

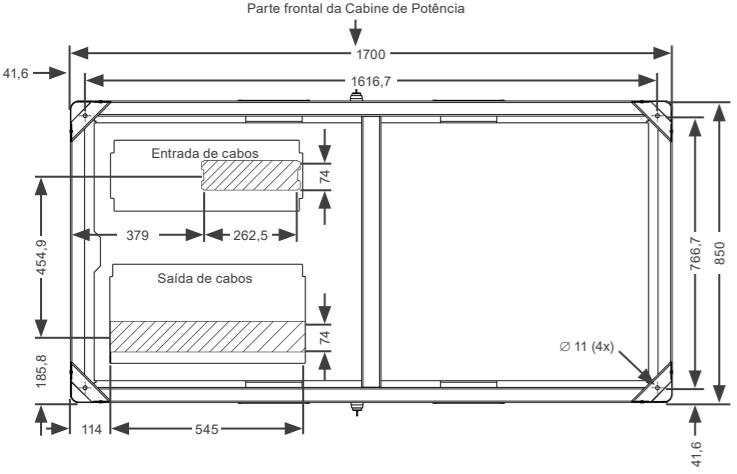

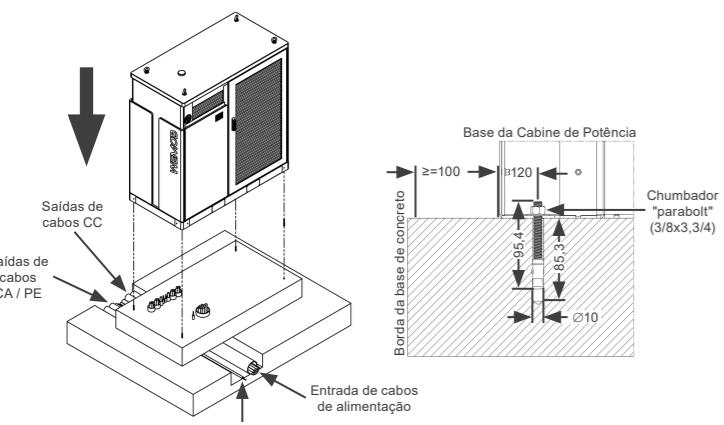

Figura 4.6: Dimensões para fixação e passagem dos cabos da Cabine de Potência - mm

A Cabine de Potência deve ser cuidadosamente baixada, utilizando equipamento de içamento ou empilhadeira. Certifique-se do alinhamento entre os furos da base da Cabine de Potência e os pontos de fixação da base de concreto. Se os cabos de alimentação, CC ou rede Ethernet já estiverem passados pelos eletrodutos, cuidado para não danificá-los durante a fixação da Cabine de Potência.

4.6 ABERTURA E FECHAMENTO DAS PORTAS

Para ter acesso ao disjuntor de alimentação e aos bornes de saída para ligação com os Totens, são necessárias as aberturas das portas frontal e traseira da Cabine de Potência.

A abertura e fechamento das portas são feitas através de uma fechadura do tipo tubular, somente acessível pelo lado interno, para ter acesso a ela, se faz necessário a abertura das portas venezianas, utilizando as maçanetas escamoteáveis, do tipo "levante e gire".

Para abrir a porta da Cabine de Potência siga as instruções abaixo:

1. Insira a chave no miolo da fechadura da porta veneziana, gire a chave para destravar, caso esteja usando um cadeado para proteção adicional, retire o cadeado.
2. Puxe a maçaneta para cima.
3. Gire a maçaneta no sentido horário.
4. Abra a porta veneziana.

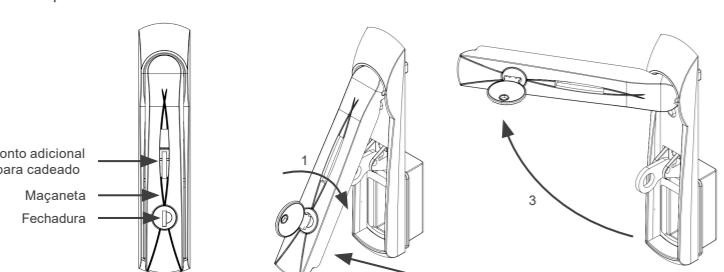

Figura 4.8: Instruções para abertura da porta veneziana da Cabine de Potência

5. Insira a chave tubular especial no miolo da fechadura de segurança, localizada junto a estrutura interna da Cabine de Potência.

6. Gire a chave no sentido horário.

7. Abra a porta.

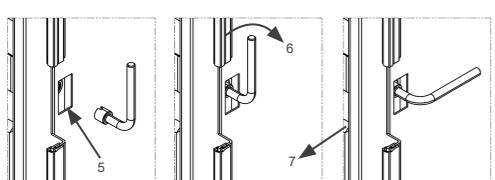

Figura 4.9: Instruções para abertura da porta da Cabine de Potência

Para fechar, basta seguir a ordem reversa.

5 INSTALAÇÃO ELÉTRICA

As informações a seguir têm a intenção de servir como guia para se obter uma instalação correta. Seguir também as normas de instalações elétricas aplicáveis à sua localidade.

PERIGO!

- A Cabine de Potência da estação de recarga WEMOB-STATION HPC demanda alta corrente e consequentemente potência elevada para seu funcionamento. Certifique-se que os requisitos de demanda sejam atendidos pela concessionária da energia elétrica.
- As proteções e instalações devem seguir as normas nacionais, estaduais e locais de instalações elétricas.
- Certifique-se que a rede de alimentação esteja desconectada antes de iniciar as ligações.
- A tensão da rede de alimentação deve ser compatível com a faixa de tensão da Cabine de Potência WEMOB-STATION HPC.
- A Cabine de Potência deve ser obrigatoriamente ligada a um terra de proteção (PE).
- A resistência de aterramento deve ser menor que 100 Ω ou inferior ao valor máximo definido nas normas de instalação elétrica aplicáveis.

ATENÇÃO!

- Quando forem utilizados cabos flexíveis para as conexões de alimentação, aterramento e interligação, é necessário utilizar terminais adequados nas pontas dos cabos.
- Todas as conexões elétricas devem ser firmemente apertadas de forma a não haver risco de falsoamento, aquecimento excessivo ou queda de tensão nos circuitos.
- Recomenda-se a utilização de condutores de cobre.
- Assegure-se que durante a instalação e utilização, os componentes da Cabine de Potência estejam constantemente e adequadamente ligados ao terra de proteção (PE).
- Conecte primeiro o condutor PE antes de prosseguir com a montagem dos restantes condutores.
- Não compartilhar a fiação de aterramento com outros equipamentos que operem com altas correntes (como por exemplo: máquinas de solda, motores de alta potência, entre outros).

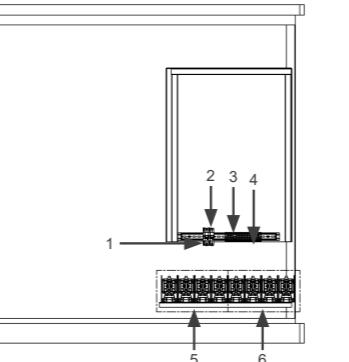

Figura 5.2: Ajuste da tensão da rede de alimentação

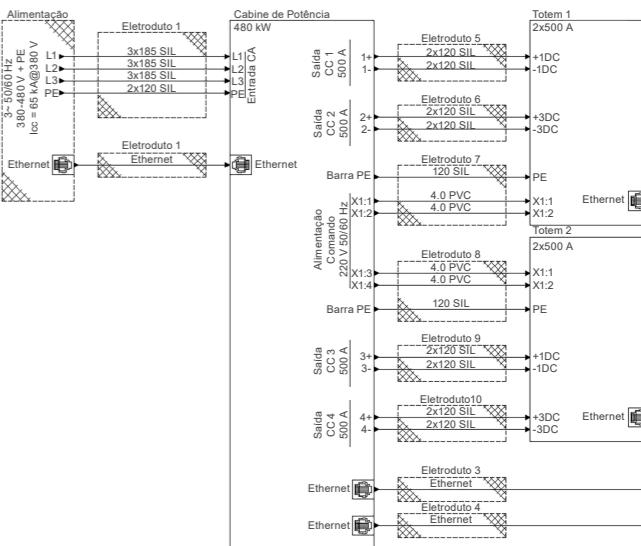

Figura 5.4: Esquema de ligação: alimentação, Cabine de Potência e Totens

5.1 CONEXÃO DA REDE DE ALIMENTAÇÃO (CA)

ATENÇÃO!

- Verifique na etiqueta de identificação do produto qual a faixa da tensão de operação da Cabine de Potência.
- Realizar a conexão do primário do transformador de alimentação "T1" conforme a tensão da rede de alimentação.
- A Cabine de Potência possui internamente um disjuntor em caixa moldada que garante a proteção de sobrecarga e curto-circuito, denominado "Q1". Para ter acesso ao disjuntor "Q1" e demais componentes, é necessária a retirada de uma chapa de proteção.

A conexão da Cabine de Potência à rede elétrica é feita diretamente nas barras de entrada do disjuntor "Q1" (Fases L1, L2 e L3) e na barra Terra (PE) (aferimento da estrutura).

Recomenda-se utilizar condutores de cobre com bitolas mínimas de:

Tabela 5.1: Recomendação mínima dos condutores e máxima corrente de entrada

Modelo (Potência da Cabine)	Corrente Máxima de Entrada			Condutor Mínimo Fases (L1 – L2 – L3) Conexão M12	Condutor Mínimo Terra (PE) Conexão M12
	380 V	440 V	460 V		
480 kW	803 A	694 A	663 A	3x185 mm ² (Por fase)	2x120 mm ²

NOTA!

- As bitolas dos condutores especificadas consideram a tensão de alimentação de 380V. Um esquema detalhado de ligação é apresentado na Figura 5.4.
- Condutores mínimos informados considerando-se isolamento em borracha de silicone +200 °C, 1kV, em cobre, temperatura de trabalho no condutor à +70 °C máximo, método de referência B1 e temperatura ambiente +40 °C.
- Cada barra de entrada possui dois (02) furos M12, cada furo M12 permite a conexão de até dois (02) terminais, uma pela frente e outro por trás da barra.
- O torque recomendado de aperto dos parafusos M12 dos terminais olhal é de 84 Nm.

A bitola adequada dos condutores do cabo de alimentação CA depende da potência e da distância do painel de distribuição até a Cabine de Potência. Podem ser usados cabos únicos ou duplos para atender a potência necessária. Observe possíveis fatores de correção da capacidade de corrente dos cabos em razão da forma de instalação, temperatura, distância e queda de tensão. Sob certas circunstâncias, isso pode levar ao aumento da seção transversal do cabo.

As conexões nas barras de entrada do disjuntor "Q1" devem ser feitas utilizando terminal olhal, pré-isolado ou de compressão.

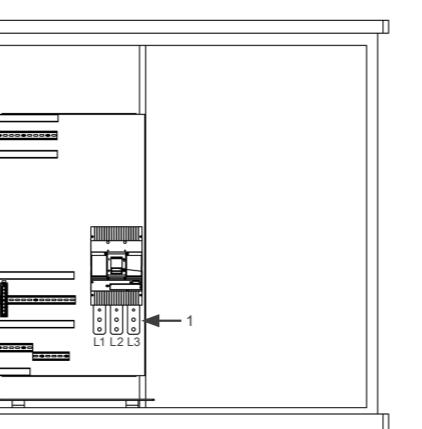

Figura 5.1: Conexões dos cabos de alimentação - Fases (L1-L2-L3) e aterramento (PE)

5.1.1 Seleção da Tensão Nominal de Alimentação

Os Totens, os circuitos auxiliares e os circuitos de comando são alimentados a partir de um transformador interno. É preciso selecionar qual a tensão nominal da rede de alimentação, 380, 440, 460 ou 480 VCA, no conjunto de bornes TAG: XV.

Para fazer este ajuste, siga as instruções abaixo:

1. Abra a porta veneziana traseira para ter acesso a porta traseira.
2. Retire a chapa de proteção.
3. Localize o conjunto de bornes XV na parte inferior da Cabine de Potência (Figura 5.2).
4. Usando uma chave de fenda 4 mm, retire os três (03) cabos dos bornes XV/R/S/T e reposicione nos bornes R/S/T: 380, 440, 460 ou 480 V, de acordo com a tensão de alimentação desejada.

ATENÇÃO!

- A alimentação CA dos Totens deve ser feita através dos bornes X1 da Cabine de Potência, não sendo permitida alimentação direta da rede elétrica.
- Cada Totem deve ser ligado a uma saída CA da Cabine de Potência, não sendo permitido utilizar apenas uma saída CA da Cabine de Potência para alimentar mais de um Totem.

5.2.3 Cabo de Comunicação Ethernet

A conexão do cabo Ethernet da Cabine de Potência para o Totem (os Totens) é feita através do switch Ethernet SW localizado no lado superior da Cabine de Potência com acesso através da porta frontal, conforme Figura 5.1. O conector RJ45 do switch segue o padrão Fast Ethernet 100BASE-TX, utilizando dois pares de cabos para transmissão e recepção de dados. Passe o cabo Ethernet RJ45 pelos eletrodutos junto a base da Cabine de Potência até a respectiva porta RJ45 disponível no switch, vide Figura 5.3. Utilizar cabo padrão Ethernet, 100 Base-TX (Fast Ethernet), CAT 5e ou superior, com comprimento máximo de 100 metros (100 m). Para evitar interferência na comunicação, os cabos de potência deverão estar separados, o mais distante possível, do cabo de comunicação Ethernet.

NOTA!

Não é possível fazer a ligação em cadeia (daisy chain).
