ABOUT THE MANUAL

This manual provides the required information for the operation of the CFW500 frequency inverter using the user’s programming module, called SoftPLC. This manual must be used together with the user’s manual of the CFW500 and WLP software.

ABBREVIATIONS AND DEFINITIONS

<table>
<thead>
<tr>
<th>Abbreviation</th>

<td>Ladder Language Programming Software</td>
</tr>
<tr>
<td>USB</td>
<td>Universal Serial Bus</td>
</tr>
</tbody>
</table>

NUMERICAL REPRESENTATION

Decimal numbers are represented by means of digits without suffix. Hexadecimal numbers are represented with the letter ‘h’ after the number.
1 INTRODUCTION TO SOFTPLC

The SoftPLC is a resource that adds the functionalities of a PLC to the CFW500, providing the product with flexibility and allowing the user to develop its own applications (user’s programs).

The main SoftPLC characteristics are:

- Programming in “Ladder Language” using the WLP software.
- Access to all Parameters and I/Os of the CFW500.
- 50 configurable parameters for the user’s use.
- PLC, Mathematical and Control Blocks
- On-line transfer and monitoring of the software application via Serial/USB interface.
- Transfer of the application software installed on the CFW500 to the PC with password restriction.
- Storage of the software application on the FLASH memory board.
- Execution directly on the RAM.

1.1 SYMBOL OF THE DATA TYPES

%KW word-type constants (16 bits)
%KF float type constants (32 bits, floating point)
%MX bit markers
%MW word markers (16 bits)
%MF float markers (32 bits, floating point)
%SX system bit markers
%SW system word markers (16 bits)
%IX digital inputs
%IW analog inputs (16 bits)
%QX digital outputs
%QW analog outputs (16 bits)
%UW user parameters (16 bits)
%UW user parameters (16 bits)
%PD drive parameter (16 bits)
2 SOFTPLC MEMORY

The total size of the SoftPLC parameter is 7684 bytes for program memory and data memory.

NOTE!
The SoftPLC application is stored in the memory of the plug-in used at the moment of download. Therefore, if the plug-in is changed, it will be necessary to download the application again.

2.1 MEMORY

- SoftPLC function: 7684 bytes
- SoftPLC User Parameter: 508 bytes

2.2 DATA MEMORY

The SoftPLC data memory area (user variables) is shared with the programming memory. Therefore, the total size of an application may vary as a function of the number of variables applied by the user.

The bit, word and float markers are allocated according to the LAST address used on the application, that is, the longer the last address, the larger the allocated area. Therefore, it is recommended to use the markers in a SEQUENTIAL manner.

The word and float constants do also use program memory space.

2.2.1 Constants

Table 2.1: Constant Memory Map

<table>
<thead>
<tr>
<th>Sym.</th>
<th>Description</th>
<th>Bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>%KW</td>
<td>Word Constants (16 bits)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>It depends on the number of different word constants. E.g.: If there were used:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- %KW: 327 = 2 bytes</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- %KW: 5; 67 = 4 bytes</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- %KW: 13; 1000; 4 = 6 bytes</td>
<td></td>
</tr>
<tr>
<td>%KF</td>
<td>Float Constants (32 bits – IEEE)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>It depends on the number of different float constants. E.g.:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- %KF: -0,335 = 4 bytes</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- %KF: 5,1; 114,2 = 8 bytes</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- %KF: 0,0; 115,3; 13,333 = 12 bytes</td>
<td></td>
</tr>
</tbody>
</table>

2.2.2 Physical Inputs and Outputs (Hardware)

Table 2.2: I/O Memory Map

<table>
<thead>
<tr>
<th>Sym.</th>
<th>Description</th>
<th>Range</th>
<th>Bytes</th>
</tr>
</thead>
<tbody>
<tr>
<td>%IX</td>
<td>Digital Inputs</td>
<td>1 ... 8</td>
<td>2</td>
</tr>
<tr>
<td>%QX</td>
<td>Digital Outputs</td>
<td>1 ... 5</td>
<td>2</td>
</tr>
<tr>
<td>%IW</td>
<td>Analog Inputs/Frequency</td>
<td>1 ... 4</td>
<td>8</td>
</tr>
<tr>
<td>%QW</td>
<td>Analog Outputs/Frequency</td>
<td>1 ... 3</td>
<td>6</td>
</tr>
</tbody>
</table>

NOTE!
The %IW4 marker corresponds to the frequency input. In order to activate this input, it is necessary to set P0246 to 1.

NOTE!
The %QW3 marker corresponds to the frequency output. In order to activate this output, it is necessary to set P0257 according to the desired function. Furthermore, note that the DO2 circuit is configured in open collector.
NOTE!
The values of the Analog/Frequency Inputs (%IW) and of the Analog/Frequency Outputs (%QW) respectively read and written via SoftPLC respect their gains (P0232, P0237, P0242, P0247: %IW1−%IW4 and P0252, P0255, P0258: %QW1−%QW3) and offsets (P0234, P0239, P0244, P0249: %IW1−%IW4).

NOTE!
The values read or written via SoftPLC obey the following rules, respecting the parameters related to the analog input and output signal types (P0233, P0238, P0243: %IW1−%IW3 and P253, P256: %QW1−%QW2):

- **Option: 0 to 10V/20mA**
  - 0V or 0mA = 0
  - 10V or 20mA = 32767
- **Option: 4 to 20mA**
  - 4mA = 0
  - 20mA = 32767
- **Option: 10V/20mA to 0**
  - 10V or 20mA = 0
  - 0V or 0mA = 32767
- **Option: 20 to 4mA**
  - 20mA = 0
  - 4mA = 32767

### 2.2.3 Volatile Markers (Variables)

They consist of variables that can be applied by the user to execute the applicative logics. They can be bit markers (1 bit), word markers (16 bit) or float markers (32 bit – IEEE).

**Table 2.3: Volatile Marker Memory Map**

<table>
<thead>
<tr>
<th>Sym.</th>
<th>Description</th>
<th>Range</th>
<th>Bytes</th>
</tr>
</thead>
</table>
| %MX  | Bit Markers   | 5000...6099 | It depends on the last used marker. They are organized in byte pairs. E.g.:
|      |               |         | - last marker: %MX5000 = 2 bytes
|      |               |         | - last marker: %MX5014 = 2 bytes
|      |               |         | - last marker: %MX5016 = 4 bytes
|      |               |         | - last marker: %MX5039 = 6 bytes
| %MW  | Word Markers  | 8000...8199 | It depends on the last used marker. E.g.:
|      |               |         | - last marker: %MW8000 = 2 bytes
|      |               |         | - last marker: %MW8001 = 4 bytes
|      |               |         | - last marker: %MW8007 = 16 bytes
| %MF  | Float Markers | 9000...9199 | It depends on the last used marker. E.g.:
|      |               |         | - last marker: %MF9000 = 4 bytes
|      |               |         | - last marker: %MF9001 = 8 bytes
|      |               |         | - last marker: %MF9007 = 32 bytes

**NOTE!**
In order to minimize the application size, use the markers in a sequential manner. E.g.:

- Bit markers: %MX5000, %MX5001, %MX5002, ...
- Word markers: %MW8000, %MW8001, %MW8002, ...
- Float markers: %MF9000, %MF9001, %MF9002, ...

### 2.2.4 System Markers

They consist of special variables that allow the user to read and change inverter data that may or may not be available in the parameters. They can be: system bit markers (1 bit) or system word markers (16 bits).
### Table 2.4 (a): Memory Map for the Odd System Bits – Writing/Command

</tr>
<tr>
<td>3320</td>
<td>Inverter rated current [A x10]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3322</td>
<td>Unfiltered motor current (P003) [A x10]</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3324</td>
<td>Unfiltered motor torque [% x10]</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**NOTE!**
The system word markers %SW3300 use a 13-bits resolution (8192 → 0 to 8191), which the motor synchronous speed. Thus, if the speed reference via “Reference” block (%SW3301) is 4096 for a VI pole motor (this means a synchronous speed of 1200 rpm), the motor will run at 600 rpm.

**NOTE!**
Equation for the calculation of the motor speed in rpm:

\[
\text{Speed in rpm} = \frac{\text{synchronous speed in rpm} \times \text{speed in 13 bits}}{8192}
\]

**NOTE!**
Equation for the calculation of the motor speed in Hz:

\[
\text{Speed in Hz} = \frac{\text{synchronous frequency in Hz (P0403)} \times \text{speed in 13 bits}}{8192}
\]

### 2.2.5 Parameters

The parameters from P1010 to P1059 appear on the keypad only when there is a valid application (user program) in the memory, i.e., when P1000 > 0.

### Table 2.6: Parameter Memory Map

<table>
<thead>

2.3 MODBUS

2.3.1 Modbus protocol SoftPLC addresses

Table 2.7: SoftPLC x Modbus Address Range

<table>
<thead>
<tr>
<th>Sym.</th>
<th>Description</th>
<th>SoftPLC</th>
<th>MODBUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>%IX</td>
<td>Digital Inputs</td>
<td>1 ... 8</td>
<td>2201...2208</td>
</tr>
<tr>
<td>%QX</td>
<td>Digital Outputs</td>
<td>1 ... 5</td>
<td>2401...2405</td>
</tr>
<tr>
<td>%IW</td>
<td>Analog Inputs/Frequency</td>
<td>1 ... 4</td>
<td>2601...2605</td>
</tr>
<tr>
<td>%QW</td>
<td>Analog Outputs/Frequency</td>
<td>1 ... 3</td>
<td>2801...2802</td>
</tr>
</tbody>
</table>

**NOTE!**
The %IW4 marker corresponds to the frequency input. In order to activate this input, it is necessary to set P0246 to 1.

**NOTE!**
The %QW3 marker corresponds to the frequency output. In order to activate this output, it is necessary to set P0257 according to the desired function. Furthermore, note that the DO2 circuit is configured in open collector.

**NOTE!**
All the other data types have the user addresses (SoftPLC) equal to the Modbus addresses. E.g.: %PD0100 = Modbus address 100; %MX5000 = Modbus address 5000; %SW3308 = Modbus address 3308.

2.3.2 Protocol

Refer to the RS232/RS485 Serial Communication manual, at the Modbus Protocol chapter.
3 RESUME OF THE FUNCTION BLOCKS

This chapter contains a summary of the function blocks that are available for the user programming.

3.1 CONTACTS

They send to the stack the content of a programmed data (0 or 1), which can be of the following type:
- %MX: Bit Marker
- %IX: Digital Input
- %QX: Digital Output
- %UW: User Parameter
- %SX: System Bit Marker – Reading

3.1.1 Normally Open Contact – NO CONTACT

%MX5000

Menu: insert-Contacts-NO CONTACT.

E.g.: It sends to the stack the content of bit marker 5000.

3.1.2 Normally Closed Contact – NC CONTACT

%QX1

Menu: insert-Contacts-NC CONTACT.

E.g.: It sends to the stack the negated content of digital output 1.

3.1.3 AND Logic with Contacts

When the contacts are in series, an AND logic is executed among them, storing the result in the stack. Examples:

<table>
<thead>
<tr>
<th>Example</th>
<th>Truth Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>%IX1 %IX2</td>
<td>%IX1</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

| %UW1010 %QX1 | %UW1010 | %QX1 | Stack |
| %UW1010. (%QX1) | 0 | 0 | 0 |
| 0 | 1 | 0 |
| 1 | 0 | 1 |
| 1 | 1 | 0 |

3.1.4 OR Logic with Contacts

When the contacts are in parallel, an OR logic is executed among them, storing the result in the stack. Examples:

<table>
<thead>
<tr>
<th>Example</th>
<th>Operation</th>
<th>Truth Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>%IX1 %IX2</td>
<td>%IX1 + %IX2</td>
<td>%IX1</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

| %UW1010 %QX1 | %UW1010 + (%QX1) | %UW1010 | %QX1 | Stack |
| %UW1010. (%QX1) | 0 | 0 | 1 |
| 0 | 1 | 0 |
| 1 | 0 | 1 |
| 1 | 1 | 1 |
Resume of the Function Block

3.2 COILS

They save the content of the stack on the programmed data (0 or 1), which can be of the following type:

- %MX: Bit Marker
- %QX: Digital Output
- %UW: User Parameter
- %SX: System Bit Marker – Writing

It is allowed to add coils in parallel at the last column.

3.2.1 Normal Coil - COIL

Menu: Insert-Coils-COIL
E.g.: It sets the bit marker 5001 with the stack content

3.2.2 Negated Coil – NEG COIL

Menu: Insert-Coils-NEG COIL
E.g.: It sets the digital output 2 with the negated content of the stack

3.2.3 Set Coil – SET COIL

Menu: Insert-Coils-SET COIL
E.g.: It sets the user parameter 1011, provided that the content of the stack is not 0

3.2.4 Reset Coil – RESET COIL

Menu: Insert-Coils-RESET COIL
E.g.: It resets the user parameter 1011, provided that the content of the stack is not 0

3.2.5 Positive Transition Coil – PTS COIL

Menu: Insert-Coils-PTS COIL
E.g.: It sets the bit marker 5002 during 1 scan cycle, provided that a transition from 0 to 1 in the stack is detected.

3.2.6 Negative Transition Coil – NTS COIL

Menu: Insert-Coils-NTS COIL
E.g.: It sets the system bit marker 3011 during 1 scan cycle, provided that a transition from 1 to 0 in the stack is detected.

3.3 MOVEMENT BLOCKS

3.3.1 Speed and/or Torque Reference – REF

Menu: Insert-Function Blocks-Movement-REF
Input:
EN: Enables block
Output:
ENO: Goes to 1 when EN ≠ 0 and without error
Properties:
MODE: 0=Speed Mode
SPEED: Speed reference [RPM, 13 Bits, Hz (x10)]
TORQUE: Not available
In the example above, if the EN is active, and the digital input 1 is off, then the block will generate a speed reference according to the user parameter 1010 in the rpm unit. If there is no error (example: disabled inverter), the ENO output goes to 1.

### 3.4 PLC BLOCKS

#### 3.4.1 Timer – TON

**Menu:** Insert-Function Blocks-PLC-TON

**Input:**
- IN: Enables the block

**Output:**
- Q: Goes to 1 when IN ≠ 0 and ET ≥ PT

**Properties:**
- PT: Programmed time (Preset Time)
- ET: Elapsed Time

In the example above, if the IN input is active and the content of the word marker 8000 is greater than or equal to the content of the user parameter 1010, the output Q is set.

#### 3.4.2 Incremental Counter – CTU

**Menu:** Insert-Function Blocks-PLC-CTU

**Inputs:**
- CU: Captures the transitions from 0 to 1 at this input (Counter Up)
- R: Resets CV

**Output:**
- Q: Goes to 1 when CV ≥ PV

**Properties:**
- PV: Programmed value (Preset Value)
- CV: Counter Value (Counter Value)

In the example above, if the content of the word marker 8001 is greater than or equal to 20, the output Q is set.

#### 3.4.3 Proportional-Integral-Derivative Controller – PID

**Menu:** Insert-Function Blocks-PLC-PID

**Inputs:**
- EN: Enables the block

**Output:**
- ENO: EN Input image

**Properties:**
- TS: Sampling time
- SELREF: Automatic/manual reference
- REF: Automatic reference
- δREF: Time constant of the automatic reference filter
- REFMANUAL: Manual reference
- KP: Proportional gain
- KI: Integral gain
- KD: Derivative gain
- MAX: Maximum output value
- MIN: Minimum output value
- TYPE: Academic/parallel
- OPT: Direct/reverse
- OUT: Controller output

In the example above, if the input EN is active, the controller starts its operation. The content of the user parameter 1010 selects the reference that is active, that is, whether it is the float marker 9001 (automatic reference) or 9003 (manual reference). There is a 0.05s filter for the automatic reference. Since the derivative gain is fixed in 0, this indicates that de PID was converted into a PI. The value of the control output OUT,
3.4.4 Low-pass or High-pass Filter – FILTER

Represented by the float marker 9004, has the maximum and minimum limits of 100 and -100 and the sampling time of 0.050s.

3.5 CALCULATION BLOCKS

3.5.1 Comparator – COMP

In the example above, if the EN input is active and the content of the float marker 9000 is greater than the float marker 9001, then the output ENO is set.

NOTE!
If FORMAT is integer, all the numerical data are considered words of 15 bits + signal (-32768 to 32767).

3.5.2 Math Operation – MATH

In the example above, if the EN input is active, the content of the float marker 9000 will be filtered with a time constant of 0.25s by a low-pass and filter and will be transferred to the float marker 9001.
Resume of the Function Block

RESL (representing the high and low parts of the result) and also as QUOC and REM (representing the quotient and remainder of a division)

OVER: Indicates if the result exceeded its limit
SIGNAL: Result sign

In the example above, when the input EN is active, the value of the word marker 8000 is incremented at each scan cycle. When the bit marker 5000 goes to 1, it indicates overflow and the word marker 8000 remains in 32767.

NOTE! If FORMAT is integer, all the numerical data are considered words of 15 bits + sign (-32768 to 32767).

3.5.3 Math Function - FUNC

Menu: Insert-Function Blocks-Calculation-FUNC
Input:
EN: Enables the block
Output:
ENO: Indicates if the calculation has been executed
Properties:
FORMAT: Integer or floating point
IN: Data to be calculated
FUNCTION: Mathematic function (sin, cos, etc)
OUT: Calculation result

In the example above, when the EN input is active, the float marker 9001 presents the result of the float marker 9000 sine calculation.

NOTE! If FORMAT is integer, all the numerical data are considered words of 15 bits + sign (-32768 to 32767).

3.5.4 Saturator – SAT

Menu: Insert-Function Blocks-Calculation-SAT
Input:
EN: Enables the block
Output:
ENO: Indicates if saturation has occurred, provided that EN ≠ 0
Properties:
FORMAT: Integer or floating point
IN: Input data
MAX: Maximum allowed value
MIN: Minimum allowed value
OUT: Output data

In the example above, when the EN input is active, the word marker 8000 contains the user parameter 1010 value, but limited between the maximum of 100 and the minimum of -100.

NOTE! If FORMAT is integer, all the numerical data are considered words of 15 bits + sign (-32768 to 32767).

NOTE! If the value of MIN is greater than the MAX, the outputs OUT and ENO are reset to zero.
3.6 TRANSFER BLOCKS

3.6.1 Data Transfer – TRANSFER

Menu: Insert-Function Blocks-Transfer-TRANSFER
Input:
EN: Enables the block
Output:
ENO: Indicates that the transfer has been done
Properties:
SRC: Source data
DST: Destine data

In the example above, if the EN input is active, the word constant 1 is transferred to the system bit marker 3001 (general enable).

3.6.2 Conversion from Integer (16 bits) to Floating Point – INT2FL

Menu: Insert-Function Blocks-Transfer-INT2FL
Input:
EN: Enables the block
Output:
ENO: Indicates that the transfer has been done
Properties:
INT: Integer data
FLOAT: Data converted into floating point

In the example above, if the EN input is active, the content of word marker 8153 (taking into account its sign) is converted to floating point to the float marker 9005.

NOTE!
INT is treated as word of 15 bits + sign (-32768 to 32767).

3.6.3 User Fault or Alarm Generator - USERERR

Menu: Insert-Function Blocks-Transfer-USERERR
Input:
EN: Enables the block
Output:
ENO: It indicates 1 when EN = 1 and the alarm or error has been effectively generated.
Properties:
CODE: Fault or alarm code.
TYPE: 0: Generates alarm, 1: Generates fault
TEXTL1: HMI line 1 text (Not available)
TEXTL2: HMI line 2 text (Not available)

In the example above, if the EN input is active, A750 will appear.

NOTE!
If this block is configured as Fault, it is necessary to reset the drive so as to enable it again.
3.6.4 Convert from Floating Point to Integer (16 bits) – FL2INT

![Function Block Diagram]

Menu: Insert-Function Blocks-Transfer-FL2INT

Input:
EN: Enables the block

Output:
ENO: Indicates that the transfer has been done

Properties:
FLOAT: Floating point data
INT: Data converted into integer

In the example above, if the EN input is active, the float constant $4.54 \times 10^4$ is converted into an integer with sign via word marker 8000. However, after the conversion, the word marker 8000 will remain with the value 32767, because this is the positive limit for a Word.

**NOTE!**
INT is treated as word of 15 bits + sign (-32768 to 32767).

3.6.5 Indirect Data Transfer – IDATA

![Function Block Diagram]

Menu: Insert-Function Blocks-Transfer-IDATA

Input:
EN: Enables the block

Output:
ENO: Indicates that the transfer has been done

Properties:
CMD: Read/Write command
DATATYPE: Data type
ADDRESS: User address
VALUE: Read content/Value to be written

In the example above, if the EN input is active, the content of the bit marker 5000 is written to the digital output whose address is the content of the word marker 8000.

3.6.6 Multiplex – MUX

![Function Block Diagram]

Menu: Insert-Function Blocks -Transfer-MUX

Input:
EN: Enables the mathematical operation

Output:
ENO: Indicates that the transfer has been done

Properties:
X0-X15: Binary data vector
W: Resulting word

In the example above, when the EN input is active, the digital inputs 1, 2 and 3 transfer their content to the bits 0, 1 and 2 of the user parameters P1010.
3.6.7 Demultiplexer – DMUX

Menu: Insert-Function Blocks-Transfer-DMUX

Input:
EN: Enables the mathematic operation

Output:
ENO: Indicates that the transfer has been done

Properties:
W: Source word
X0-X15: Resulting binary data vector

In the above example, when the EN input is active, the bits 1, 2, 5, 6, 11, 13 and 15 of the word marker 8000 are transferred respectively to the bit markers 5001, 5002, 5005, 5006, 5011, 5013 and 5015.
4 INVERTER PARAMETER SETTINGS

In the continuation, only the parameters of the CFW500 frequency inverter that are related to the SoftPLC will be presented.

4.1 SYMBOLS FOR PROPERTY DESCRIPTION

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RO</td>
<td>Read-only parameter.</td>
</tr>
<tr>
<td>CFG</td>
<td>Parameter that can be changed only with a stopped motor.</td>
</tr>
<tr>
<td>Net</td>
<td>Parameter visible on the keypad if the inverter has a network interface installed – RS232, RS485, CAN, Profibus – or if the USB interface is connected.</td>
</tr>
<tr>
<td>Serial</td>
<td>Parameter visible on the keypad if the inverter has the RS232 or RS485 interface installed.</td>
</tr>
<tr>
<td>USB</td>
<td>Parameter visible on the keypad if the inverter USB interface is connected.</td>
</tr>
</tbody>
</table>

4.2 CFW500 CONFIGURATION PARAMETERS

P0100 – ACCELERATION TIME
P0101 – DECELERATION TIME
P0220 – LOCAL/REMOTE SELECTION SOURCE
P0221 – SPEED REFERENCE SELECTION – LOCAL SITUATION
P0222 – SPEED REFERENCE SELECTION – REMOTE SITUATION
P0223 – FORWARD/REVERSE SELECTION – LOCAL SITUATION
P0226 – FORWARD/REVERSE SELECTION – REMOTE SITUATION
P0224 – RUN/STOP SELECTION – LOCAL SITUATION
P0227 – RUN/STOP SELECTION – REMOTE SITUATION
P0225 – JOG SELECTION – LOCAL SITUATION
P0228 – JOG SELECTION – REMOTE SITUATION
P0246 – FREQUENCY INPUT FI
P0251 – AO1 FUNCTION
P0254 – AO2 FUNCTION
P0276 – DO2 FUNCTION
P0263 – DI1 FUNCTION
P0264 – DI2 FUNCTION
P0265 – DI3 FUNCTION
P0266 – DI4 FUNCTION
P0267 – DI5 FUNCTION
P0268 – DI6 FUNCTION
P0269 – DI7 FUNCTION
Inverter Parameter Settings

### P0270 – DI8 FUNCTION

### P0271 – DIGITAL INPUT SING

### P0275 – DO1 FUNCTION (RL1)

### P0276 – DO2 FUNCTION (RL2)

### P0277 – DO3 FUNCTION (RL3)

### P0278 – DO4 FUNCTION

### P0279 – DO5 FUNCTION

**NOTE!**
The resources of available inputs and outputs depend on the used plug-in module. For further information, please, refer to the CFW500 Programming Manual.

### 4.3 SOFTPLC EXCLUSIVE PARAMETERS

#### P1000 – SoftPLC STATUS

<table>
<thead>
<tr>
<th>Adjustable</th>
<th>Factory Setting: 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 = No Application</td>
<td></td>
</tr>
<tr>
<td>1 = Install. App.</td>
<td>0</td>
</tr>
<tr>
<td>2 = Incompat. App.</td>
<td></td>
</tr>
<tr>
<td>3 = App. Stopped</td>
<td></td>
</tr>
<tr>
<td>4 = App. Running</td>
<td></td>
</tr>
</tbody>
</table>

**Properties:** RO

**Access groups via HMI:**

01 PARAMETER GROUPS

LIKELY

50 SoftPLC

**Description:**
It allows the user to view SoftPLC status. If there are no applications installed, the parameters P1001 to P1059 will not be shown on the keypad.

If this parameter presents the option 2 ("Incompat. App."), it indicates that the version that has been loaded in the flash memory board is not compatible with the current CFW500 firmware.

In this case, it is to recompile the project in the WLP, considering the new CFW500 version and download it again. If that is not possible, the upload of this application can be done with the WLP, provided that the application password is known or is not enabled.

#### P1001 – SoftPLC COMMAND

<table>
<thead>
<tr>
<th>Adjustable</th>
<th>Factory Setting: 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>0: Stop Program</td>
<td></td>
</tr>
<tr>
<td>1 = Run Program</td>
<td></td>
</tr>
<tr>
<td>2 = Delete Program</td>
<td></td>
</tr>
</tbody>
</table>

**Properties:** CFG

**Access groups via HMI:**

01 PARAMETER GROUPS

LIKELY

50 SoftPLC

**Description:**
It allows stopping, running or excluding an installed application, but the motor must be disabled in order to do so.

NOTE!
The resources of available inputs and outputs depend on the used plug-in module. For further information, please, refer to the CFW500 Programming Manual.
## P1002 – SCAN CYCLE TIME

<table>
<thead>
<tr>
<th>Adjustable</th>
<th>0.00 to 99.99 s</th>
<th>Factory Setting: Not applicable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Properties:</td>
<td>RO</td>
<td></td>
</tr>
<tr>
<td>Access groups via HMI:</td>
<td></td>
<td>D1 PARAMETER GROUPS</td>
</tr>
<tr>
<td></td>
<td></td>
<td>L 50 SoftPLC</td>
</tr>
</tbody>
</table>

**Description:**
It consists of the application scanning time. The larger the application, the longer the scanning time.

## P1010 to P1059 – SoftPLC USER PARAMETERS

<table>
<thead>
<tr>
<th>Adjustable</th>
<th>0 to 65535</th>
<th>Factory Setting: 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Range:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Properties:</td>
<td>-</td>
<td></td>
</tr>
<tr>
<td>Access groups via HMI:</td>
<td></td>
<td>D1 PARAMETER GROUPS</td>
</tr>
<tr>
<td></td>
<td></td>
<td>L 50 SoftPLC</td>
</tr>
</tbody>
</table>

**Description:**
They consist of use parameters defined by the user via WLP software, as described in item 5.5.

**NOTE!**
The parameters P1010 to P1019 can be viewed in the monitoring mode.

**NOTE!**
When parameter P1011 is a writing parameter and it is programmed in P0205, P0206 or P0207, then its content can be changed with the HMI keys and .
5 SUMMARY OF THE WLP MAIN FUNCTIONS

This chapter brings basic information about the operations done with the WLP software for the use of the CFW500 inverter. More information can be obtained in the help of the WLP software.

5.1 PROJECT – NEW

It creates a new project. Besides defining the project name, it is also necessary to configure the equipment and the respective firmware version.

5.2 PROJECT – OPEN

It opens the selected project.

5.3 PROJECT – PROPERTIES

It allows the user to define the equipment and firmware version. In this box, it is also configure whether or not the project will have upload password.
5.4 VIEW – COMPILATION INFORMATION

It allows the user to know the compile application size in bytes (<projectname>.bin) to be sent to the equipment.

5.5 VIEW – USER PARAMETER CONFIGURATION

It opens an attribute visualization window for all the user parameters. With double click on the parameter, it is permitted the configuration of these attributes, which include:

- Parameter descriptive text (up to 21 characters);
- Unit selection;
- Minimum and maximum limit;
- Number of decimal positions;
- Hexadecimal or normal format;
- Reading or writing only;
- Modification only with a stopped motor or online;
- With or without sign;
- Ignores the password (allows modification regardless of the inverter password (P0000)) or normal;
- Displays or hides the parameter;
- Allows saving the parameter value (retentive), when it is used in some blocks (PLC, Calculations and Transfers) on power down;
- Configuration parameter which allows modification with the motor running.

Those configurations can be transferred to the CFW500 with the “Download” button.
5.6 CONSTRUCT – COMPILÉ

It analyzes the application and generates the compiled code for the specified equipment.

5.7 COMMUNICATION – CONFIGURATION

The Serial port is used for the CFW500.
5.8 COMMUNICATION – DOWNLOAD

This command allows downloading the application and/or user parameter configurations to the CFW500.

<table>
<thead>
<tr>
<th>File</th>
<th>Bytes</th>
<th>Date and Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>CFW500_V150_R01_propflash.ppx</td>
<td>202</td>

<tr>
<td>CFW500_V150_R01.bin</td>
<td>300</td>
<td>05/06/2013 - 14:40:12</td>
</tr>
</tbody>
</table>

5.9 COMMUNICATION – UPLOAD

This command makes it possible to upload and open the application installed on the CFW500, provided that the password is valid.
Summary of the WLP Main Functions
