WEG IE3-conform control and protection components: the right choice for premium efficiency motors.

The most recent change of the European directive 640/2009/EC, which came into force in January 2015, affects manufacturers and users of electric motors and switching and protection components. According to the new regulation, motors with rated outputs from 7.5 to 375 kW must not be less efficient than the IE3 efficiency level or may still be IE2 efficiency level if equipped with variable speed drives.

Lowering energy consumption and caring for the environment has always been a priority for WEG. It has been producing premium and super premium efficiency electric (IE3 and IE4 standard or equivalent) motors for over fifteen years. ***The new regulation shows how innovative WEG has always been.*** The company is aware that the design improvements in the electric motors to achieve the efficiencies will have possible impact on the switching and protection components.

Company experts list the use of cores with thinner silicon steel laminations, greater silicon concentration and windings with increased copper mass as the main optimizations. Improvements also include reduced air-gaps and a more efficient cooling system.

With the higher efficiency, it is common for IE3 motors to present higher inrush and starting currents in

comparison to IE2 motors. Therefore, ***is it necessary to use a derating factor when WEG switching and protection components are sized for IE3 motors?*** The answer to this is simple and objective: WEG's line of components has been developed and improved alongside IE3 motors, therefore, it is suitable for such purpose and no derating factor is necessary, ***WEG components are IE3-conform.***

There is still some uncertainty in the market about the effect of the changes in standards and directives. This statement seeks to inform and reassure customers. All new motors placed on the market, include within the scope of directive, have to be IE3 efficiency or above IE2 efficiency rated when equipped with a variable speed drive. If on one hand the use of premium efficiency motors is mandatory, ***the choice of switching and protection components for IE3 motors is the users decision.***

Manufacturing Know How

Committed to growth on a global scale, **WEG continually invests** in state-of-the-art manufacturing facilities and processes and on the development of reliable components. We understand that production facilities need to be **robust, reliable, innovative** and **environmentally sustainable**.

Quality Control

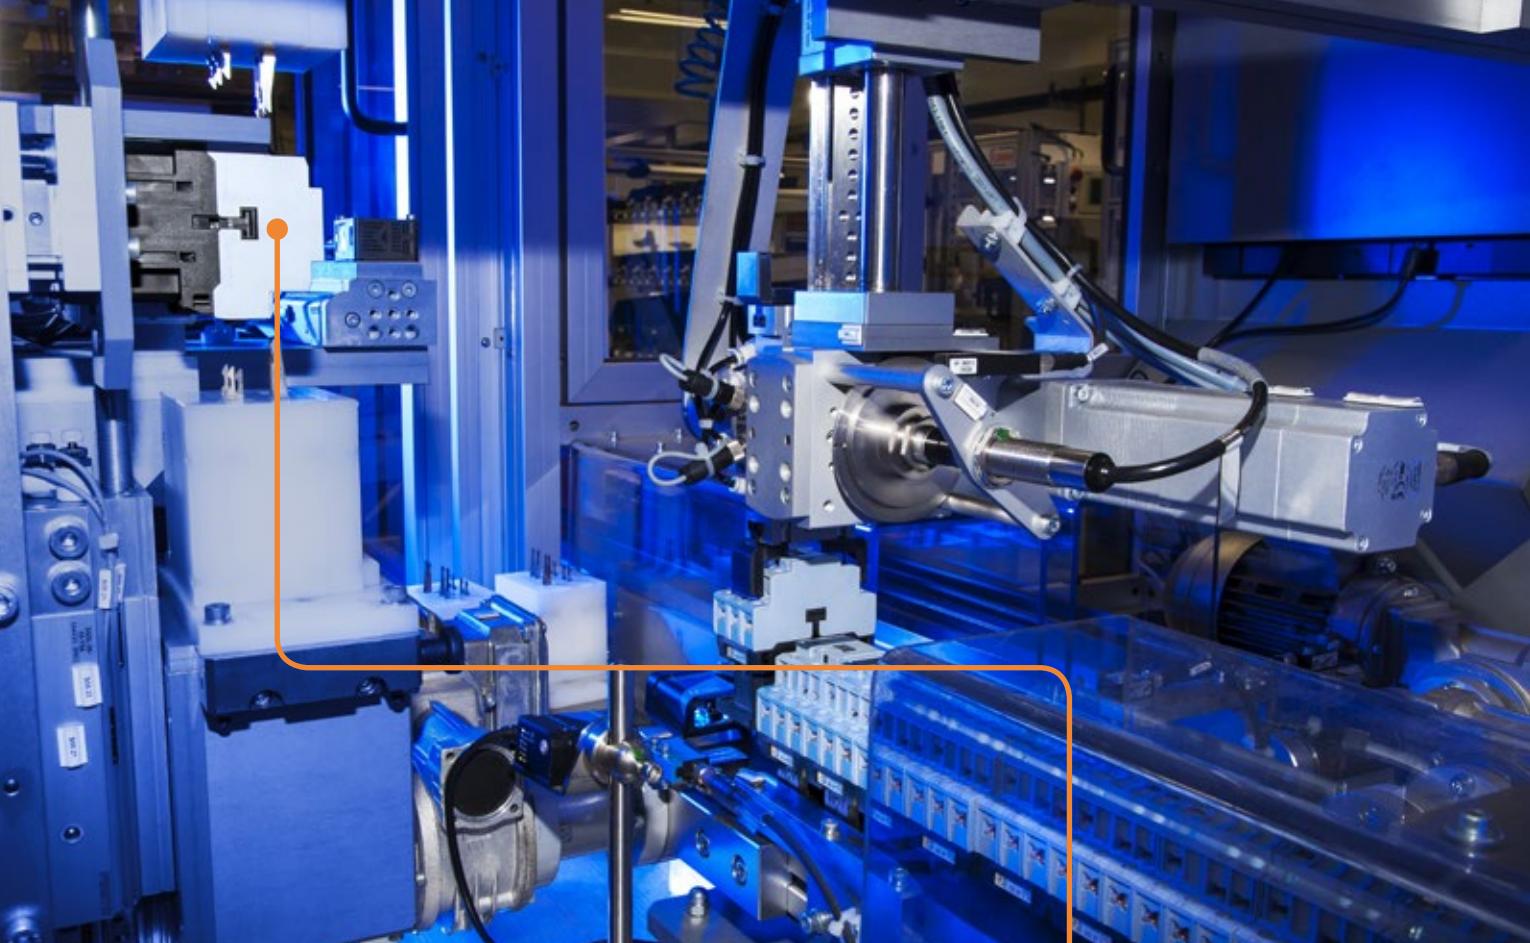

WEG's motor control and protection components are produced in facilities that work according to **the most demanding quality and process control standards** like IEC and NEMA. Our **ISO 9001**, **ISO 14001** and **ISO 50001** certifications further illustrate our commitment to standards of international quality.

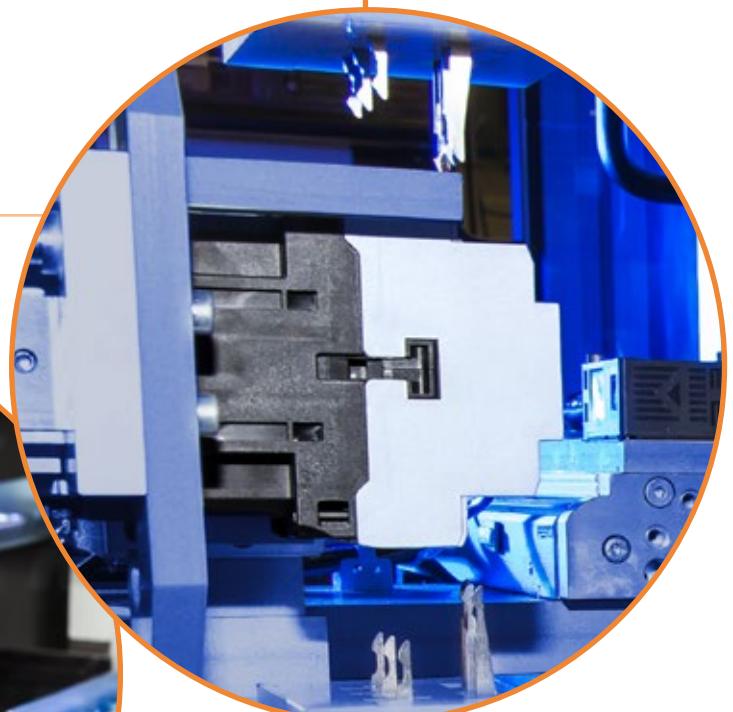

A Vertically Integrated Company

WEG is a vertically integrated company. Our facilities, renowned for their capacity, efficiency, quality control, safety and flexibility have all kinds of industrialization processes internally such as, plastic injection molding, metal stamping and machining centers, assuring increased quality control throughout the production chain.

New area in the plastic injection center.

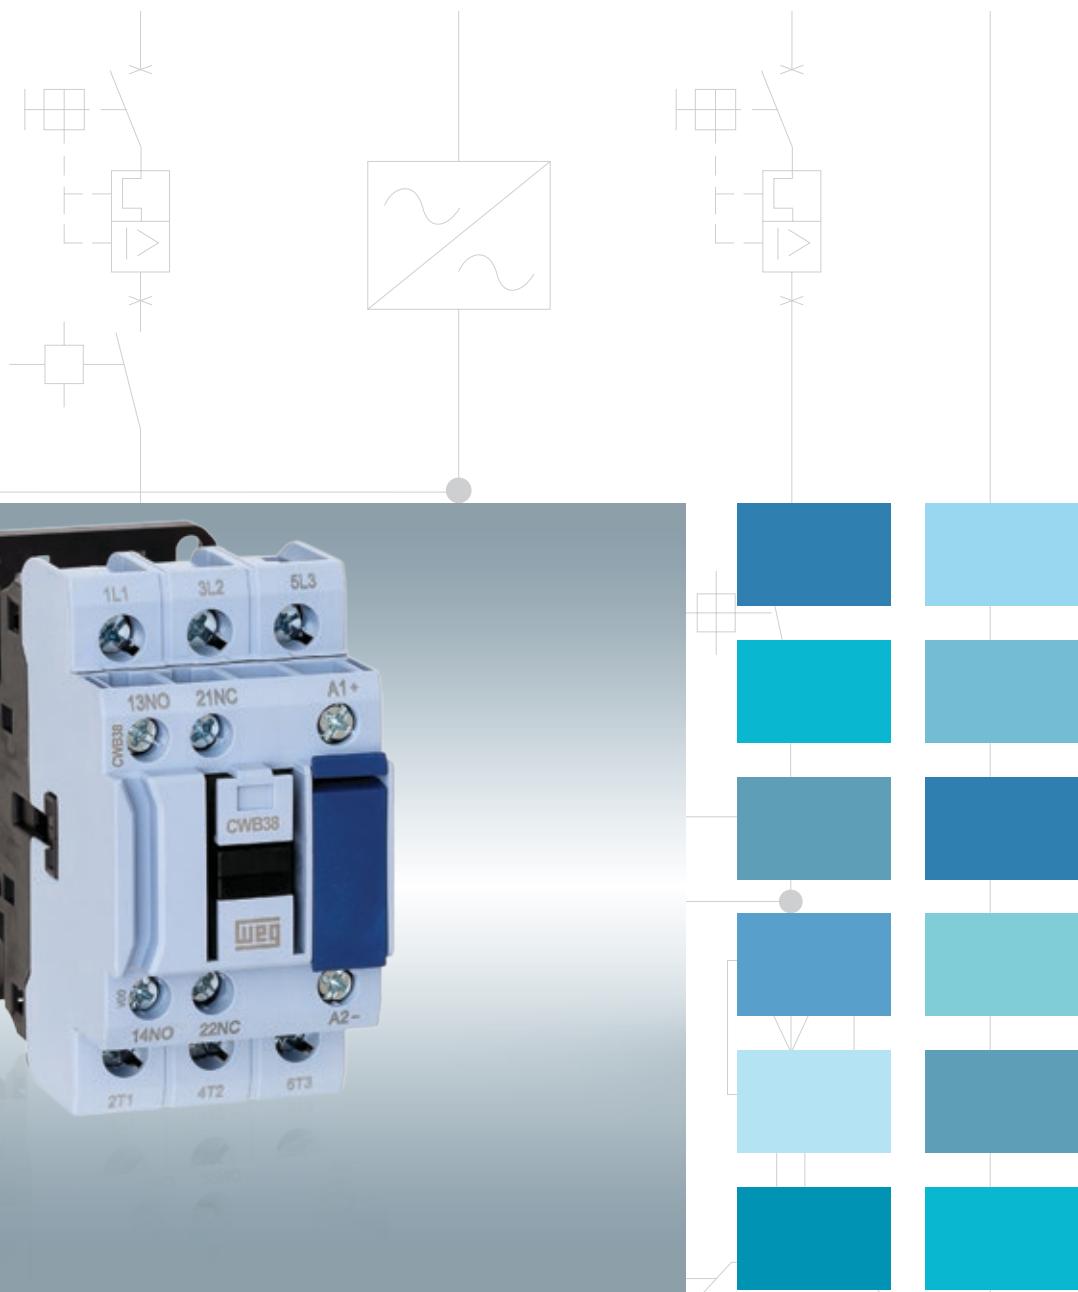

Detail of the final test on the assembly line of contactors: 100% of components are automatically tested for more than 15 different parameters such as operating limits, coil consumption, insulation voltage levels, vibration and noise among others and then individually identified for tracking purposes.

Magnetic core of contactors: precise, temperature-controlled, fully-automatic production assures a high-end product.

Contactors

CWB Line

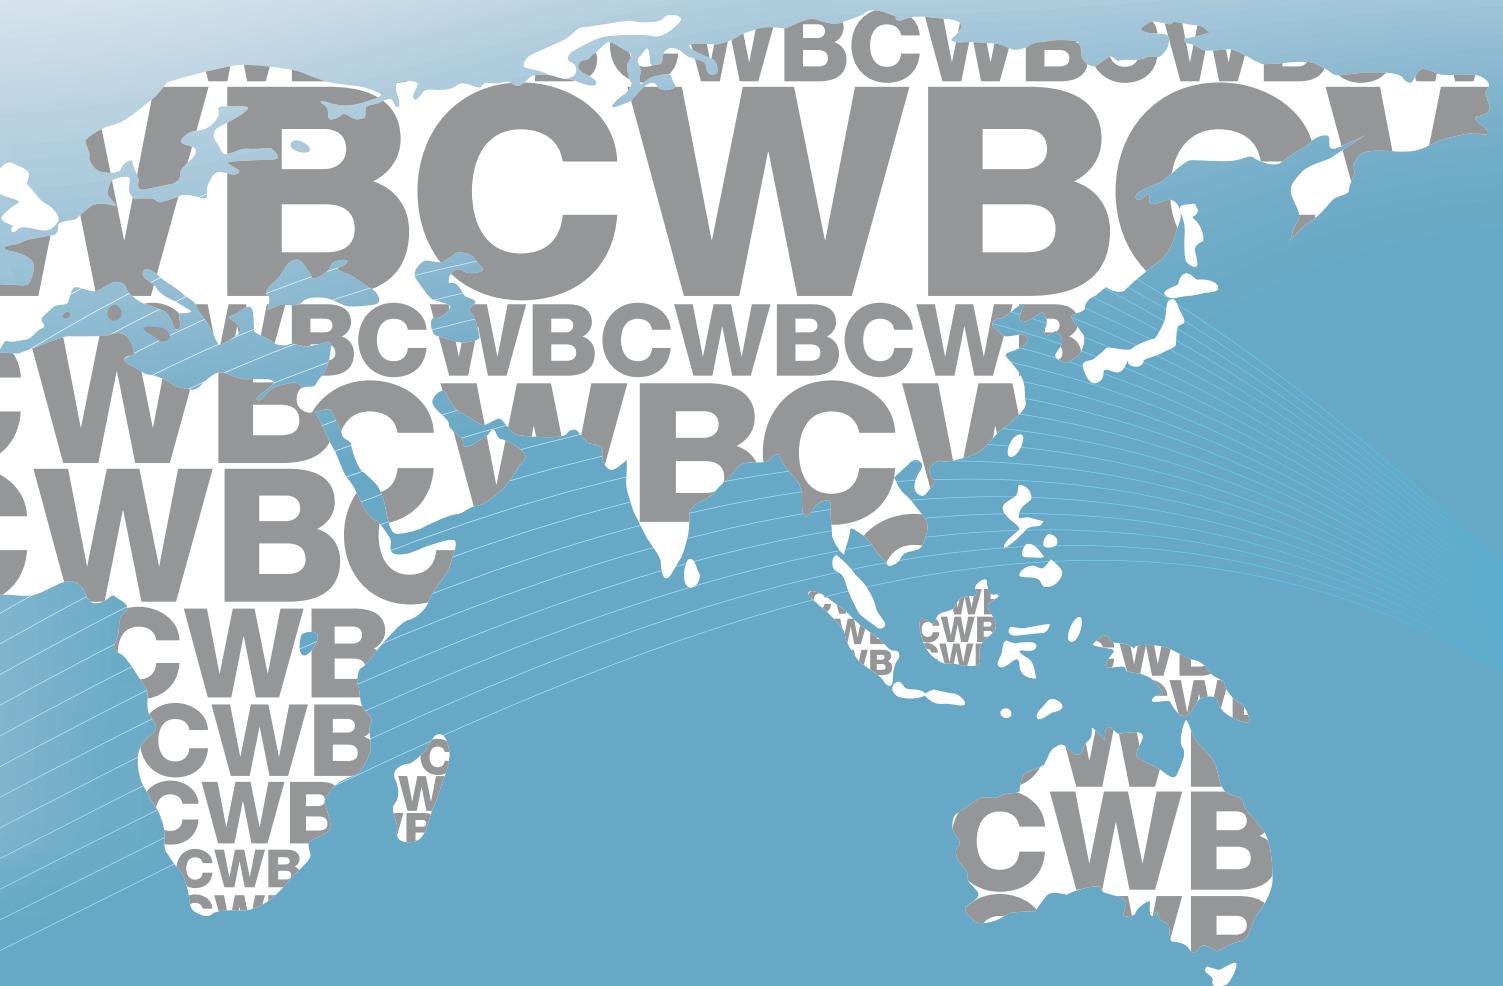

WEG

New WEG **CWB** Contactors

Developed according to IEC 60947 and UL 508 international standards, the new WEG CWB line of contactors meets the requirements of a wide range of industrial applications worldwide.

WEG CWB Contactors are modular and compact but at the same time **robust and highly reliable**. Easy installation and energy savings meet the expectations of users who want to perform automation in a more simple and practical way.

The CWBs are designed with the visual pattern and identity of WEG, a brand recognized worldwide for its quality.

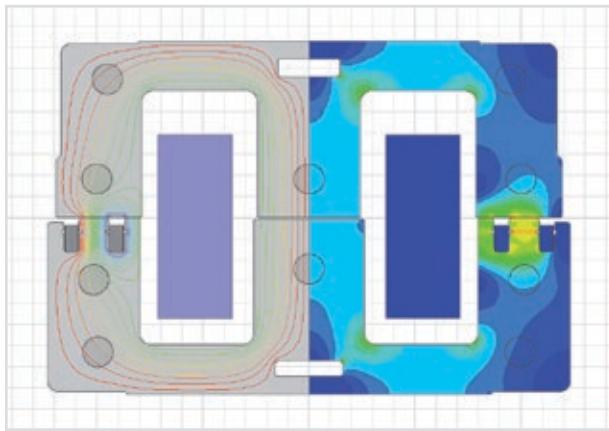

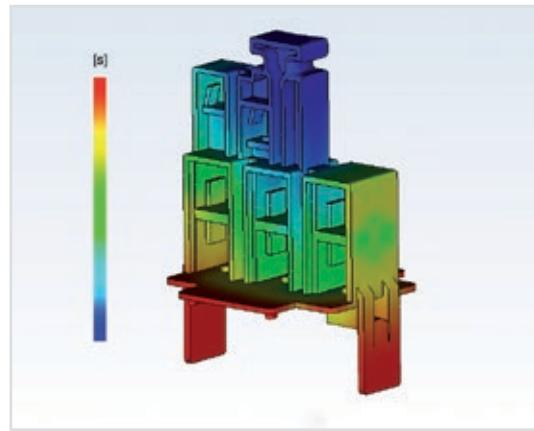

The Technology Within

The use of finite-element analysis and state-of-the-art modeling softwares for simulation of electromagnetic and electromechanical systems provide WEG CWB contactors with an improved project with reduced contact bouncing. The outcome reached by WEG's R&D team ensures a product with long mechanical and electrical lifespan in a reduced size and with lower energy consumption.

The electric contacts of CWB contactors are manufactured with special silver alloys which ensure excellent electric conductivity and high contact reliability. During operation, the double-break contacts and arc chutes ensure fast arc quenching and provide high resistance against the wear effects of the electric arc and, consequently, a long electrical lifespan.

Analysis of CWB electromagnetic system.

Simulation of plastic injection molding of CWB contact carrier.

CWB contactors are manufactured with the best raw materials from top international suppliers and with WEG high quality components, using high precision plastic injection molds and stamping tools, ensuring very reliable products with the best cost-benefit in the market.

Energy Savings

Low Consumption Coils

The low-consumption coils of new WEG contactors of up to 38 A allow safe operation with minimum energy consumption of up to 6 W in DC and up to 7.5 VA in AC. Besides energy savings, the low consumption of the coils of CWB contactors allows reducing the power supply of control transformers. When well dimensioned and properly applied, the traditional starting methods of electric motors, such as DOL (reversing or non-reversing) and star-delta using contactors, are the safest and best cost-benefit means to start and protect electric motors in low voltage. Up to at least 55 kW, DOL and star-delta starters using contactors are still the best and most widely used starting methods in all kinds of industries worldwide. Even when electronic methods are used for the start and control of motors, such as VSDs and Soft-Starters, the contactors continue to be necessary in combination with the electronic devices. Therefore, one can only imagine the huge number of contactors installed and in operation all over the world.

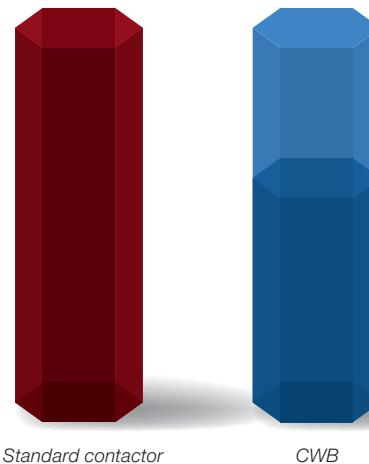

Thus, CWB contactors are designed to operate in a safe and reliable way with the lowest energy consumption.

DC Coils with no Inrush Pick-Up Current

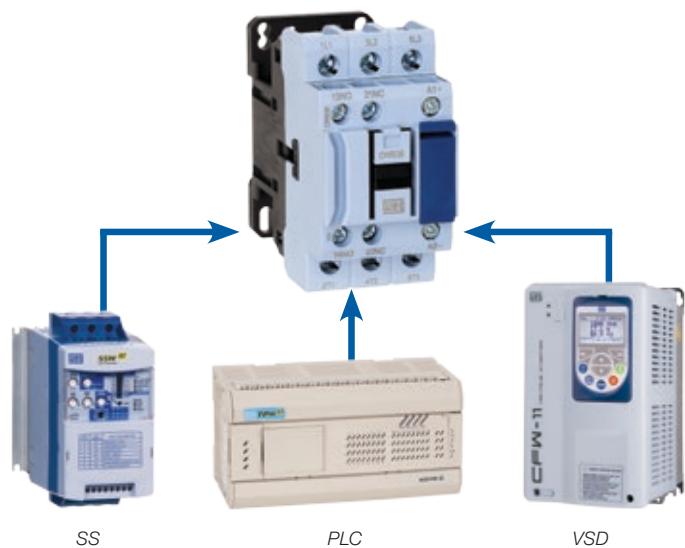

Besides low energy consumption, DC coils allow direct control of CWB contactors via PLC or digital outputs of devices such as VSDs or Soft-Starters without the need of interface relays.

Coil Consumption

DC Operated Contactor

**Energy saving
30%**

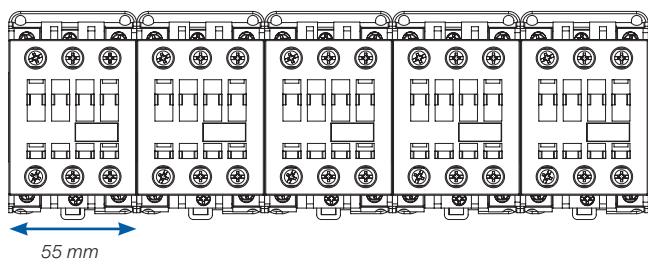

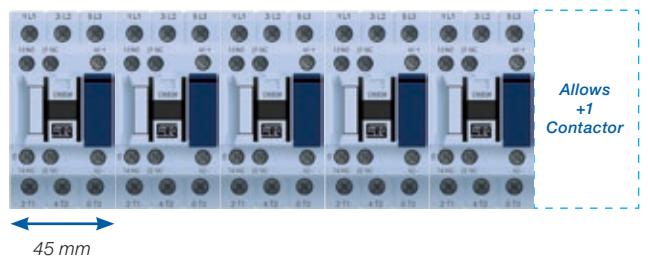

Eco-Friendly

The CWB line uses only nontoxic and eco-friendly materials that are safe and sustainable.

Easy Panel Optimization

Compact Solution

Because they are compact, 45 mm wide and available in up to 38 A (18.5 kW @ 380 / 415 V AC-3 and 25 HP @ 480 V UL 3-ph), CWB contactors lead to an overall reduction in size of electric panels if compared to traditional solutions of contactors with the same ratings.

Built-In Auxiliary Contacts 1NO + 1NC

The configuration of two built-in auxiliary contacts (1NO + 1NC) makes the application of CWB contactors more flexible in most automation systems, contributing to the optimization of internal space of electrical panels.

"Zero-Width" Mechanical Interlock

For applications which require mechanical interlock between contactors, WEG has developed a new mechanical system that ensures compact and easy mounting without the need of any tools. WEG's new mechanical interlock system allows the mechanical interlock between two contactors of the CWB line with "zero" additional side space and it is possible to assemble 90 mm wide reversing starters of up to 38 A.

Simple and Compact Mounting of Surge Suppressor Blocks

The coils of CWB contactors operate smoothly with a low level of disturbance in the control circuits. However, in order to reduce voltage surges due to the coil switching even further, WEG has developed surge suppressor blocks especially for the CWB line of contactors, which ensure limitation or even completely eliminate the undesired interferences that may be caused on opening the contactor coil. Surge suppressor blocks are easily mounted on CWB contactors without the need of any kind of tools and also without increasing volume.

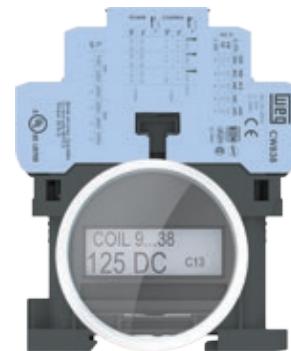

Contactor Coil Operated on AC or DC

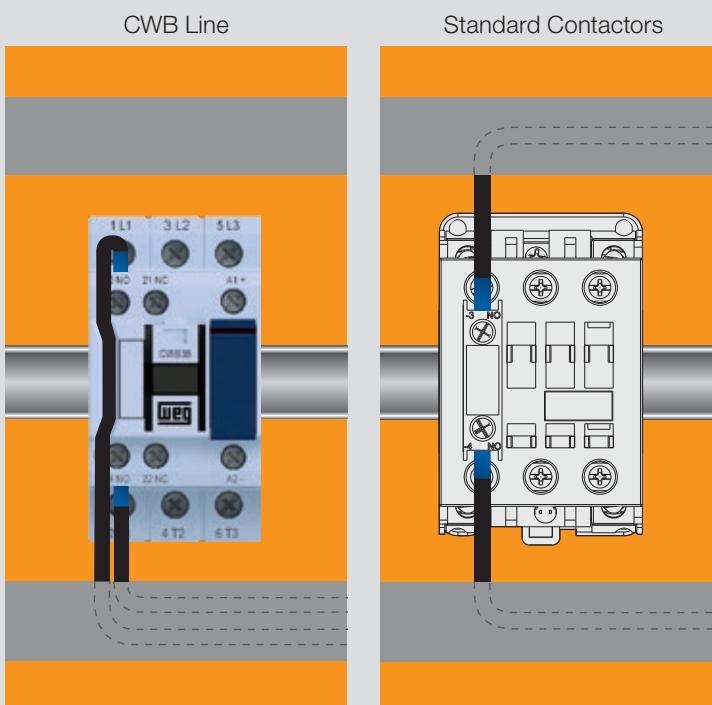

Wide range of voltages available in only two coil versions (one for AC and another for DC) to fit the whole range of contactors from 9 to 38 A. Easy AC coil replacement and visual coil voltage indication.

Contactor with AC coil

Contactor with DC coil

More Simple and Organized Control Circuits

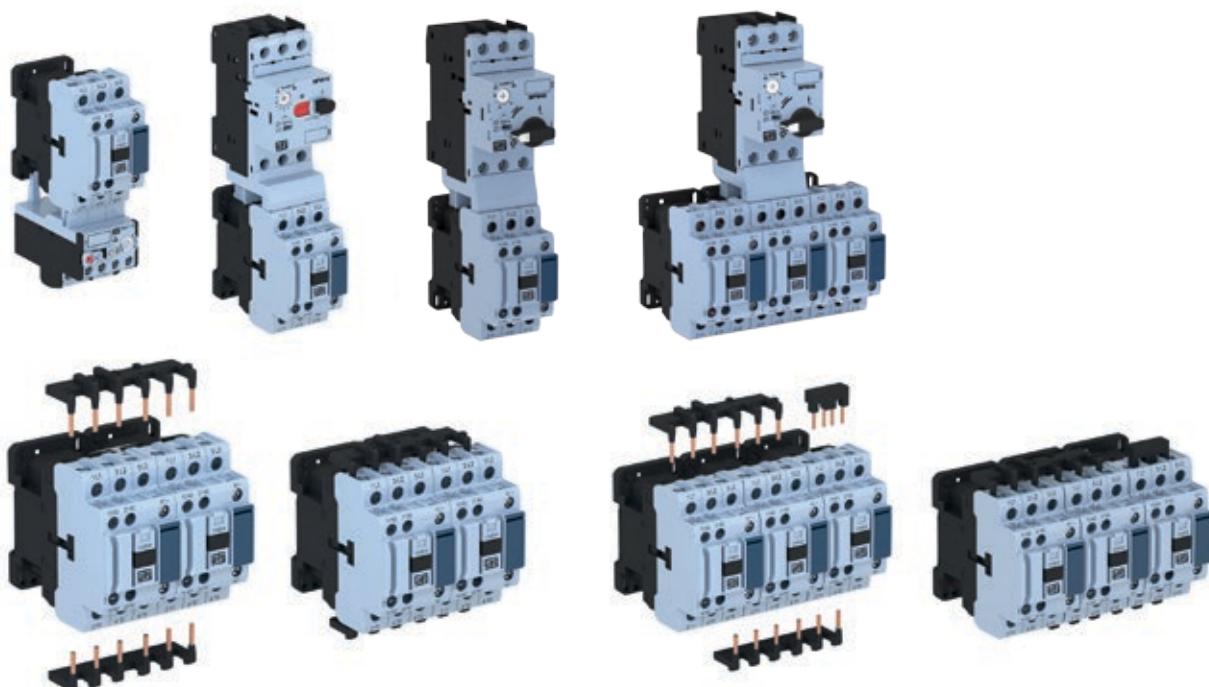

In order to optimize space in electric panels even more, the WEG CWB contactor line has a front channel for the passage of control cables. This could reduce or eliminate the need of control cable passage through the side or front part of contactors providing a "cleaner" and more organized assembly of the control circuit.

Flexibility and Modularity in Assembly of Electric Panels

Easy-Connection Busbars and Connectors

The harmonious integration between the WEG CWB line of contactors and overload relays and motor protective circuit breakers allows fast and easy assembly of compact starters and protection sets of LV electric motors with excellent cost-benefit. The modularity and flexibility of easy-connection busbars and connectors reduce assembly time, besides preventing errors. Available for CWB contactors up to 38 A, easy-connection allows the combined assembly with WEG motor protective circuit breakers and thermal overload relays forming compact and robust DOL starters (reversing and non-reversing) and star-delta starters.

Easy Access Power and Control Terminals

All power terminals, auxiliary contacts and coils provide users with fast front access, facilitating installation, measurements and interventions for preventive and corrective maintenance of starters.

Additional Contact Blocks

Besides the 1NO + 1NC built-in auxiliary contacts, in order to meet the most complex control needs, WEG has also developed auxiliary high performance contact blocks which can be easily mounted on the front or side of CWB contactors, allowing the combination of up to six auxiliary contacts per contactor up to 38 A.

An important characteristic of the side auxiliary contact blocks of the CWB line is the small dimension (only 9 mm wide) which meets the requirements of modularity, allowing more compact combinations of motor starters with motor protective circuit breakers when easy-connection busbars are used.

Panel Assembly Flexibility

CWB contactors can be easily assembled on panels using 35 mm DIN rails or screws because their oblong holes are compatible with the old and traditional lines of contactors on the market.

Safety

Safety Against Accidental Contact

All power and control terminals of CWB contactors have IP20 degree of protection, ensuring total safety against accidental frontal contact.

Safety-Related Applications

In automation systems of machines and equipment, it is common to use special contactors in combination with specific safety relays. The new WEG CWB contactors allow this combination due to the arrangement of the contacts which meets IEC 60947-4-1 Annex F (Mirror Contact) and IEC 60947-5-1 Annex L (Mechanically Linked Contact) requirements.

Contactors - Technical Data

Contactors for Switching Lamps in Lighting Circuits

When a contactor is chosen for switching lighting circuits it should be taken into account the type, number and power of lamps, the values of current during the starting phase and in the steady-state, power factor and the presence or not of compensation capacitors. Compensation capacitors and electronic devices are usually responsible for high inrush currents and may stress the contactors in lighting installations. The current consumption of lighting equipment typically

increases when the voltage decreases so it is recommended to utilize a maximum of 90% of the thermal rated current of the contactor. All the aforementioned is considered in the following tables. The tables indicate the maximum number of lamps per phase at 230 V, for single-phase or for 3-phase star-connected circuits. For 3-phase delta-connected, the total number of lamps will be as shown in the table, multiplied by 0.58. The air temperature near the contactor is considered less than or equal to 55 °C.

Notes: 1) Indicative values - It's highly recommended to take into consideration the values of making capacity and rated AC-1 current when dimensioning the contactor for AC-5b utilization category (AC-5b: switching of incandescent lamps).

2) Rated current for each lamp at rated voltage.

Contactors - Technical Data

DC - Utilization Category for CWB Contactors¹⁾

Contactors designed for AC switching can carry the same rated continuous operational DC current. But for operational voltage higher than around 60 V, the switching capacity (of direct current) decreases significantly. By connecting poles in series, the advantages are: improved switching capacity, larger contact lifespan and specially, higher operating voltages. However, this higher operating voltage may not exceed the rated insulation voltage of the contactor. Similarly, the current loading of poles connected in series is the same as for individual poles.

Utilization Category DC-1 (L/R ≤1ms)

Thermal Overload Relays

RW27-2D Thermal Overload Relay Class-10

Thermal Overload Relay

Description

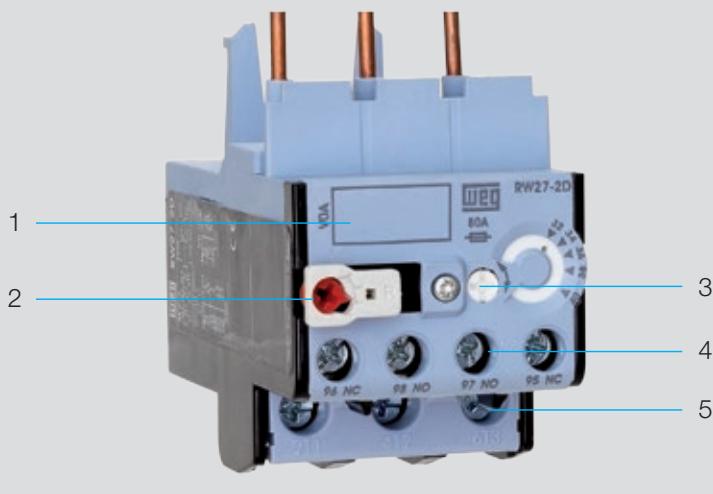

RW thermal overload relays are designed to be combined with contactors to assemble motor starters.

Thermal overload relays are very reliable devices intended to protect motors, controllers and branch-circuit conductors against phase failures and overloads that cause excessive heating.

The thermal overload relay has no power contacts and cannot disconnect the motor by itself. Motor overloads or phase failures increase the motor current. This current increase trips the mechanism and switches the auxiliary contacts.

The auxiliary contacts, when properly wired in series with the coil of the contactor will de-energize the contactor when an overload occurs. Thus, the contactor disconnects the power to the motor and stops its operation. The bimetallic thermal overload relays have thermal memory. Once tripped, the relay will not reset until it has cooled down, allowing the motor to cool before it can be re-started.

General Information

- 1 - Identification tag**
- 2 - Multifunction RESET / TEST button**
- 3 - Current setting dial**
- 4 - Auxiliary contact terminals**
- 5 - Main contact terminals**

Applications

RW thermal overload relays have been designed to protect three-phase and single-phase AC motors and direct current motors¹⁾. When the RW thermal overload relays are intended to protect single-phase AC loads or DC loads, the connection should be made as shown in the diagrams on page C-9.

RW Thermal Overload Relays in Contactor Assemblies for Wye-Delta Starters

When using thermal overload relays in conjunction with contactor assemblies for wye-delta starters, it should be taken into consideration that only $0.58 (\sqrt{3} / 3) \times$ the motor current flows through the main contactor. An overload relay mounted on the main contactor must be set to the same multiple of the motor current.

A second overload relay may be mounted on the wye contactor if it is desired the load to be optimally protected in wye operation. The wye current is $1/3$ of the rated motor current. The relay must then be set to this current.

Protection Against Short-Circuit

The RW thermal overload relays must be protected against short-circuits by fuses or circuit breakers.

Ambient Air Temperature Compensation

RW thermal overload relays are temperature compensated. Its trip point is not affected by temperature, and it performs consistently at the same value of current. The time-current characteristics of RWs refer to a stated value of ambient air temperature within the range of -20°C to $+60^{\circ}\text{C}$ and are based on no previous loading of the overload relay (i.e. from an initial cold state). For ambient air temperature within the range of $+60^{\circ}\text{C}$ up to $+80^{\circ}\text{C}$ (maximum ambient air temperature), the current correction factor shown in the table below should be applied:

Ambient air temperature	Current correction factor
65°C	0.94
70°C	0.87
75°C	0.81
80°C	0.73

Note: 1) Models RW317 and RW407 should be used only with electric motors in alternating current.

Thermal Overload Relay

Site Altitude Compensation

The site altitude and hence the air density play a role with respect to the cooling conditions and dielectric withstand voltage. A site altitude of up to 2000 m is considered as normal in accordance with IEC 60947. For higher altitudes, the current settings on the thermal overload relay should be higher than the motor rated current. On the other hand, the operational voltage must be reduced.

For site altitudes higher than 2000 m, the values for the current and voltage shown in the table below should be applied:

Altitude above sea level (m)	Adjustment factor on the current setting	Maximum operational voltage U_e (V)
2000	1.00 $\times I_n$	690
3000	1.05 $\times I_n$	550
4000	1.08 $\times I_n$	480
5000	1.12 $\times I_n$	420

Characteristic Tripping Curve

Thermal overload relays are designed to mimic the heat actually generated in the motor. As the motor temperature increases, so does the temperature of the overload relay thermal unit.

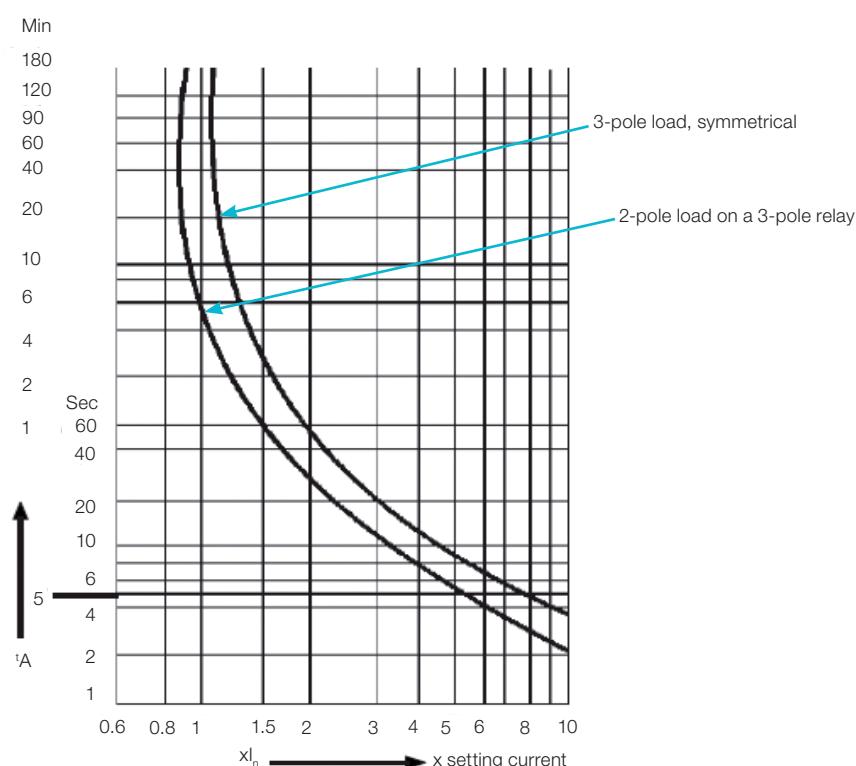

The motor and relay heating curves have a strong relationship. No matter how high the current drawn by the motor, the thermal overload relay provides protection and yet, does not trip unnecessarily.

Thus, the characteristic tripping curves indicate how the tripping time, starting from the cold state, varies with the current for multiples of the full-load current for three-pole symmetrical loads.

Phase Failure Sensitivity

In order to ensure fast tripping in case of phase loss, protecting the motor and avoiding expensive repairs / corrective maintenance services, RW27-2D thermal overload relays include phase failure sensitivity protection as standard. For this purpose, they have a differential release mechanism that, in the case of phase failure, ensures the de-energized cooled down bimetal strip to generate an additional tripping displacement (simulating an overcurrent that actually doesn't exist). This way, in the event of phase failure, the differential release ensures tripping at a lower current than with a three-phase load (characteristic curve below).

However, for more effective protection against phase failure, specific protective products should be evaluated ensuring that such failure is detected much faster. The curve below shows the tripping time in relation to the rated current. It is also considered average values of the tolerance range and at ambient temperature of 20 °C starting from the cold state.

Thermal Overload Relay

Multifunction Reset / Test Button

The thermal overload relay has a multifunction **RESET / TEST** button that can be set in four different positions:

A - Automatic **RESET** only;

AUTO - Automatic **RESET / TEST**;

HAND - Manual **RESET / TEST**;

H - Manual **RESET** only.

In **HAND** and **AUTO** positions, when **RESET** button is pressed, both NO (97-98) and NC (95-96) contacts change states.

Operation description:

In H (manual RESET only) or A (automatic RESET only) position, the test function is blocked. However in the positions HAND (manual RESET / TEST) or AUTO (automatic RESET / TEST) it is possible to simulate the test and the trip functions by pressing the RESET button.

When set in the H or HAND position the RESET button must be pressed manually to reset the overload relay after a tripping event. On the other hand, when set in A or AUTO position, the overload relay will reset automatically after a tripping event.

The H, HAND, AUTO and A function setting is carried out by rotating without pressing the red button and placing it on the desired position of the RESET button.

When changing from HAND to AUTO, the RESET button must be slightly pressed while the red button is rotated.

Functions	H	HAND	AUTO	A
Relay reset	Manual ¹⁾	Manual ¹⁾	Automatic	Automatic
Auxiliary contact trip test 95-96 (NC)	Function is disabled	Test is allowed	Test is allowed	Function is disabled
Auxiliary contact trip test 97-98 (NO)	Function is disabled	Test is allowed	Test is allowed	Function is disabled

Note: 1) A recovery time of a few minutes is necessary before resetting the thermal overload relay.

Recovery Time

The RW thermal overload relays have thermal memory.

After tripping due to an overload, the relay requires a certain period of time for the bimetal strips to cool down. This period of time is so-called recovery time. The relay can only be reset once it has cooled down. The recovery time depends on the characteristic tripping curves and the level of the tripping current. After tripping due to overload, the recovery time allows the load to cool down.

Operation in the Output Side of Frequency Inverters

The RW27-2D thermal overload relays are designed for operation on 50/60 Hz up to 400 Hz and the tripping values are related to the heating by currents within this frequency range. Depending on the design of the frequency inverter, the switching frequency can reach several kHz and generate harmonic currents at the output that result in additional temperature rise in the bimetal strips. In such applications, the temperature rise not only depends on the rms value of the current, but on the induction effects of the higher

frequency currents in the metal parts of the device (skin effect caused by eddy currents).

Due to these effects, the current settings on the overload relay should be higher than the motor rated current.

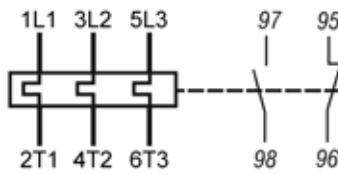

RW27-2D Thermal Overload Relay from 0.28 up to 40 A

Motor Protective Circuit Breakers

MPW12, MPW18 and
MPW40

New WEG MPW Motor Circuit Breakers

Developed according to IEC 60947 and UL 508 international standards, the new WEG MPW line of motor protective circuit breakers are modular and compact but at the same time robust and highly reliable, meeting the expectations of the most demanding users.

The MPWs are designed with the visual identity of WEG, a brand recognized worldwide for its quality.

MPW12

- Motor protective circuit breaker up to 12 A with spring clamp terminals
- Thermal-magnetic circuit breaker (provides protection against short-circuit and overload) or only magnetic circuit breaker (provides protection against short-circuit)
- Same technical features (mechanical and electrical) of former MPW16 (up to 12 A)
- Pushbutton operated

MPW18

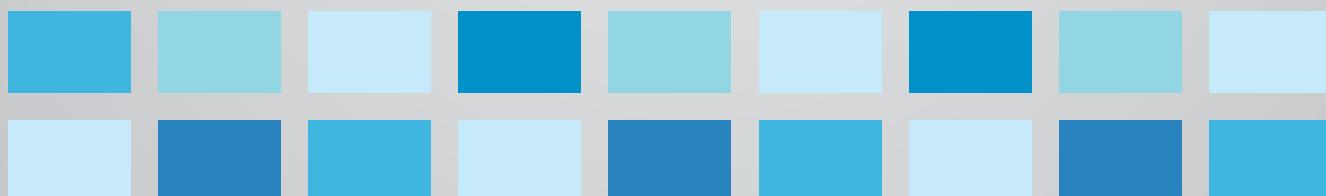

- Motor protective circuit breaker up to 18 A
- Thermal-magnetic circuit breaker (provides protection against short-circuit and overload) or only magnetic circuit breaker (provides protection against short-circuit)
- Same technical features (mechanical and electrical) of former MPW16 (up to 16 A)
- Pushbutton operated

MPW40

- Motor protective circuit breaker up to 40 A - 45 mm wide
- Thermal-magnetic circuit breaker (provides protection against short-circuit and overload) or only magnetic circuit breaker (provides protection against short-circuit)
- Same technical features (mechanical and electrical) of former MPW25 (up to 32 A)
- Rotary handle operated

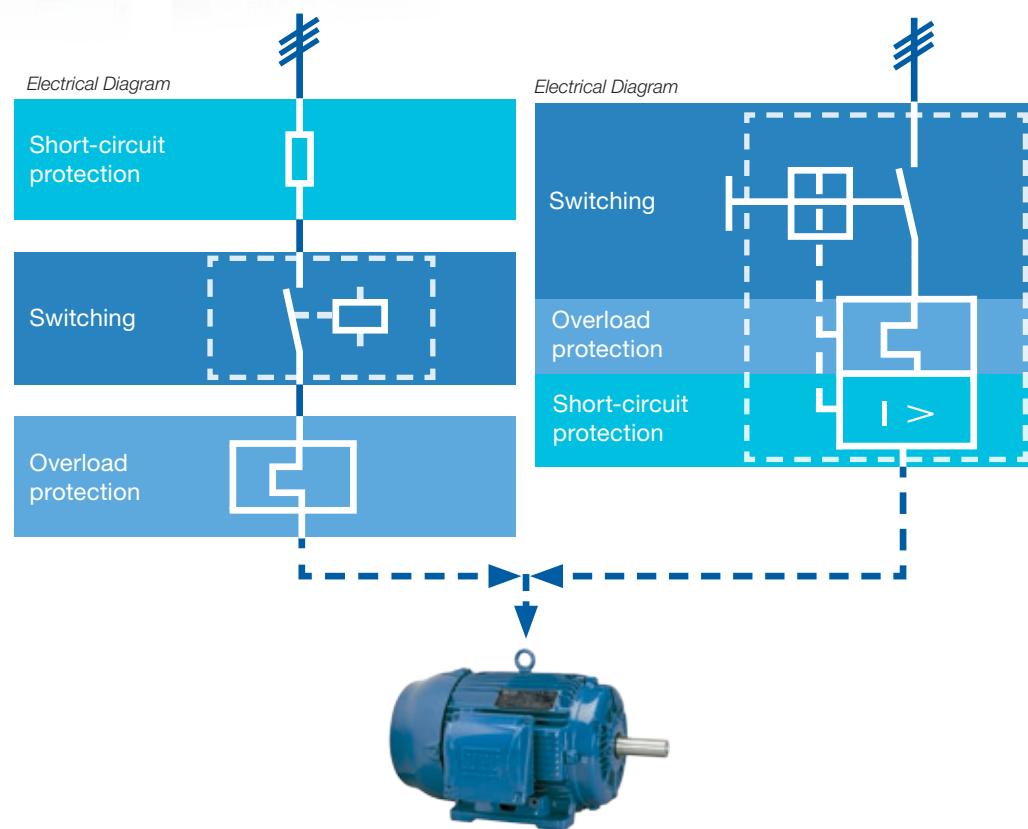

Note: 1) UL certification may not be available for specific products or current ranges.
For further information consult your sales representative.

Motor Protective Circuit Breakers
of **MPW** line, the best solution for
operating and protection of
your **electric motor**.

3 Functions in a Single Product!

Characteristics

Type	Conventional starter	Compact starter

Notes: 1) For 50/60 Hz three-phase, 4 poles WEG W22 standard motors. These values are only for reference and may change on the number of poles and motor design.

2) For overload protection, it is suggested the use of RW27-2D thermal overload relay.

MPW40t Motor Protective Circuit Breaker - Selection Table

MPW40t Motor Protective Circuit Breaker up to 20 A (Screw Terminal) - Thermomagnetic

- Motor protective circuit breaker for protection of transformers or motors with high starting current
- Allows switching and protection against overload and short-circuit of inductive loads
- Fixed short-circuit release 19 x lu
- Breaking capacity 100 kA at 380-415 V ac up to 10 A
- With phase-failure sensitivity according to IEC 60947-4-1
- With temperature compensation
- Rotary handle operated
- For use as main switch

MPW40t Motor Protective Circuit Breaker - Thermomagnetic - Overload and Short-Circuit Protection

Notes: 1) For 50/60 Hz three-phase, 4 poles WEG W22 standard motors. These values are only for reference and may change on the number of poles and motor design.

2) For overload protection, it is suggested the use of RW27-2D thermal overload relay.

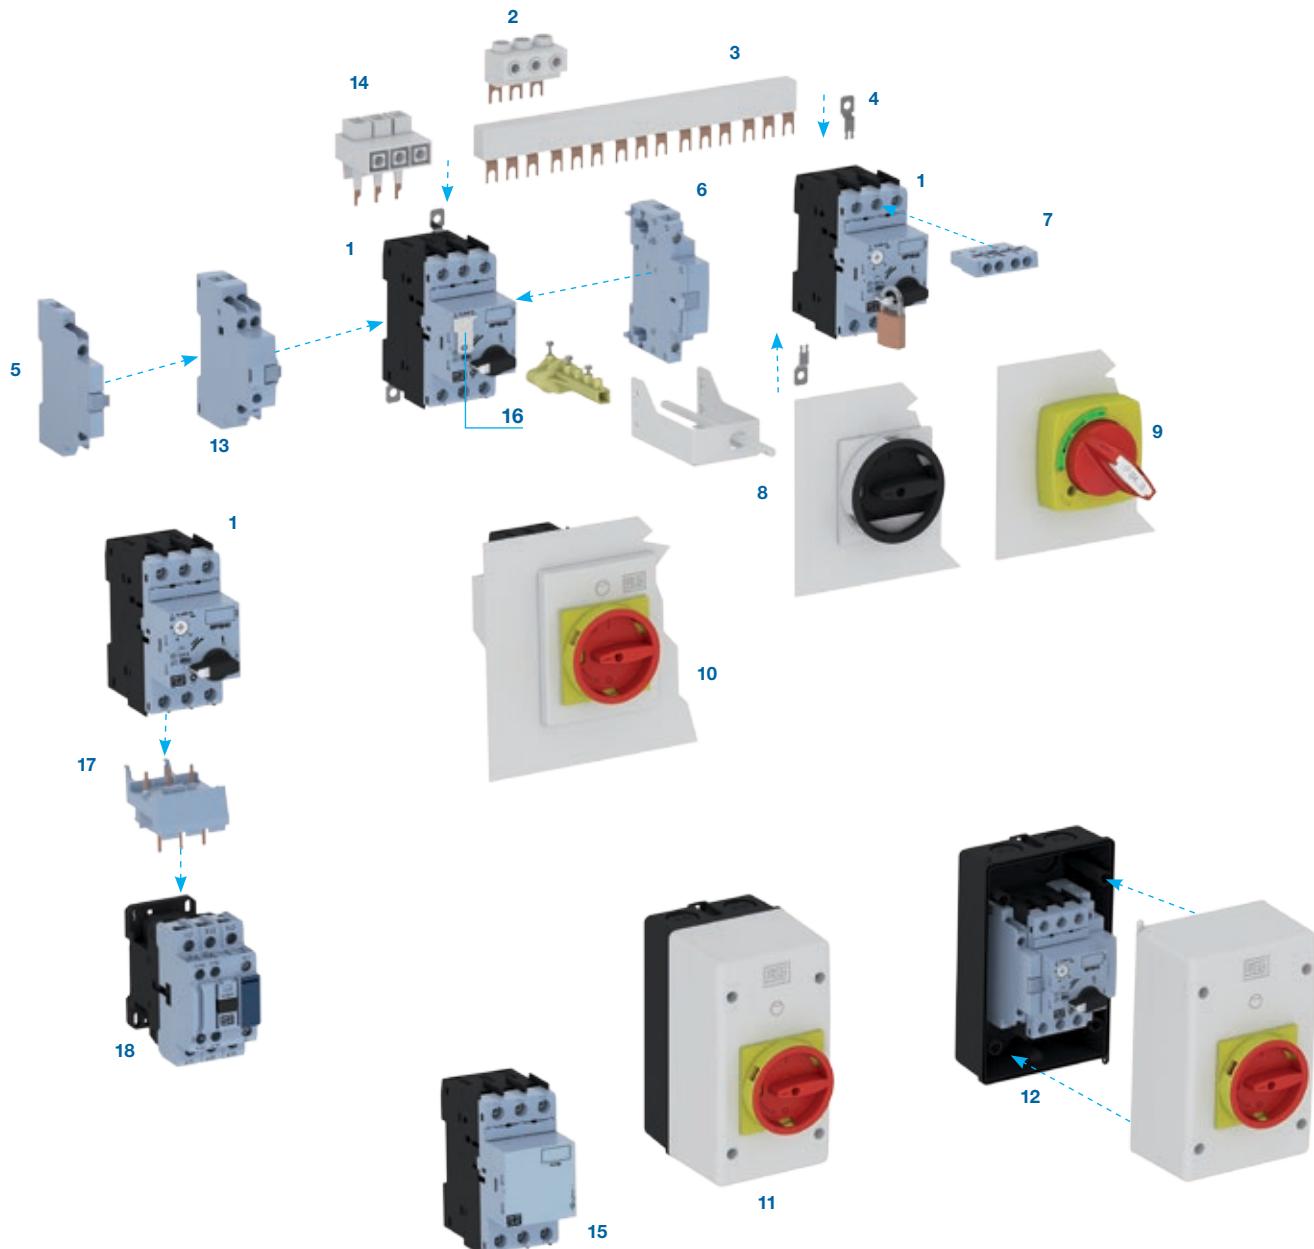

MPW12...MPW18 Motor Protective Circuit Breakers - Overview

- 1 - MPW18 motor protective circuit breaker (screw terminal)
- 2 - Feeder terminal FTBBS
- 3 - Three-phase busbars BBS
- 4 - Push-in-lugs PLMP
- 5 - Side mounted auxiliary contact block ACBS (screw terminal)
- 6 - Undervoltage release URMP or shunt release SRMP (screw terminal)
- 7 - Front mounted auxiliary contact block ACBF (screw terminal)
- 8 - Insulated enclosure

- 9 - Scale cover SCMP
- 10 - Trip signaling block TSB
- 11 - Emergency pushbutton for insulated enclosure
- 12 - MPW12 motor protective circuit breaker (spring terminal)
- 13 - Side mounted auxiliary contact block ACBS_S (spring terminal)
- 14 - Front mounted auxiliary contact block ACBF_S (spring terminal)
- 15 - MPE41 plastic cover for IP66
- 16 - CWB9...38 contactors
- 17 - Link module ECCMP-18B38 (MPW18+CWB9...38)

MPW40 Motor Protective Circuit Breaker - Overview

- 1 - MPW40 motor protective circuit breaker (screw terminal)
- 2 - Feeder terminal FTBBS
- 3 - Three-phase busbars BBS
- 4 - Push-in-lugs PLMP
- 5 - Side mounted auxiliary contact block ACBS (screw terminal)
- 6 - Undervoltage release URMP or shunt release SRMP (screw terminal)
- 7 - Front mounted auxiliary contact block ACBF (screw terminal)
- 8 - Door coupling rotary handle RMMP
- 9 - Door coupling rotary handle MRX

- 10 - Front plate FME55
- 11 - Standard insulated enclosure MPE55
- 12 - Large insulated enclosure MLPE55
- 13 - Trip signaling block TSB
- 14 - LST25 - Feeder terminal for "Type E" motor starter according to UL
- 15 - Current limiter CLT32
- 16 - Scale cover SCMP
- 17 - Link module ECCMP-40B38 (MPW40+CWB9...38)
- 18 - CWB9...38 contactors

Notes: 1) 500 V with plastic enclosure.

2) Reduce current for temperatures exceeding +60 °C (87% to 70 °C).

3) Only available with spring terminal.

Altitude - Correction Factor

The MPW motor protective circuit breakers do not undergo any change to their specified performance when applied at an altitude of up to 2000 meters above sea level. However, as the altitude increases, the atmospheric properties vary in terms of dielectric rigidity and pressure. Therefore, current and voltage correction factors must be applied for altitudes exceeding 2000 meters, as shown in the following table:

Altitude (above sea level) - h	Rated operational voltage U_e	Current correction factor I_u
$h \leq 2000$ m	690 V	$1 \times I_n$
$2000 < h \leq 3000$ m	550 V	$0.96 \times I_n$
$3000 < h \leq 4000$ m	480 V	$0.93 \times I_n$
$4000 < h \leq 5000$ m	420 V	$0.90 \times I_n$

MPW Motor Protective Circuit Breakers - Technical Data

Main Terminal Capacity

Undervoltage Release - URMP

Reference	URMP	
For use with	MPW12...40	
Rated insulation voltage Ui	690 V	
Operating voltage (enables circuit breaker switch ON)	0.85...1.1 x Ue	
Non-operating voltage (guarantees circuit breaker switch OFF)	0.35...0.7 x Ue	
Energization consumption	20.2 VA / 13 W	
Consumption	7.2 VA / 2.4 W	
Max. opening time	20 ms	
Type of terminal	Flat	
Type of screws	Phillips (Nº 2)	
Tightening torque	1...1.5 N.m (7...10 lb.in)	
Rigid cable	1 or 2 x (0.5...1.5 mm ²) 1 or 2 x (0.75...2.5 mm ²) 1 or 2 x (18...14 AWG)	1 or 2 x (0.5...1.5 mm ²) 1 or 2 x (0.75...2.5 mm ²) 1 or 2 x (18...14 AWG)
Flexible cable		1 or 2 x (18...14 AWG)
Backup fuses gL/gG	10 A	

Notes: 1) Mandatory use (finely stranded cable without end sleeve is not allowed).

2) 8 AWG for flexible cable only.

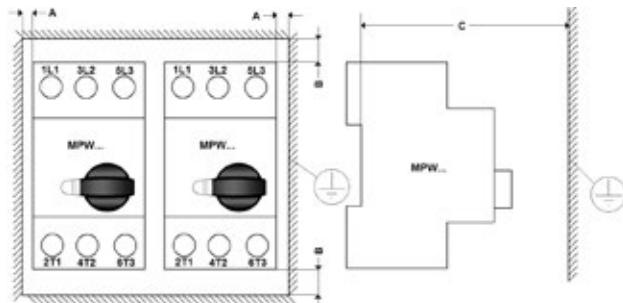

MPW Motor Protective Circuit Breakers - Technical Data

Shunt Release - SRMP

Reference codes	SRMP
For use with	MPW12...40
Rated insulation voltage U_i	690 V
Operating voltage (guarantee cir. breaker switch OFF)	0.7...1.1 x U_e
Energization consumption	20.2 VA / 13 W
Max. opening time	20 ms
Type of terminal	Flat
Type of screws	Phillips (Nº 2)
Tightening torque	1...1.5 N.m (7...10 lb.in)
Rigid cable	1 or 2 x (0.5...1.5 mm ²) 1 or 2 x (0.75...2.5 mm ²)
Flexible cable	1 or 2 x (18...14 AWG)
Backup fuses gL/gG	10 A

Mounting Configurations for MPW Motor Protective Circuit Breaker

Model	U_e	Minimum distance between the circuit breaker and live or grounded parts (mm)		
		B	C	A
MPW12...18	Up to 690 V	20	75	9
MPW40	Up to 500 V	30	95	9
	Up to 690 V	50	95	30

The motor protective circuit breaker can be mounted in any position, but according to IEC 60447 standard, the "On - I" indicator must be to the right, or up.

DC Operation

The MPW12...40 can also be used for operating continuous current loads. For such operation it is necessary to connect 2 or 3 poles in series.

See recommended circuits and their voltage limits in the table on the right.

Short-circuit breaking capacity $I_{cu} = 10 \text{ kA}$ for all configurations.

Circuits	Max. V dc	Notes
	150 V dc	System not grounded; 2 pole series connected.
	300 V dc	System grounded; 2 pole series connected.
	450 V dc	System grounded; 3 pole series connected.

MPW Motor Protective Circuit Breakers - Characteristics Curves

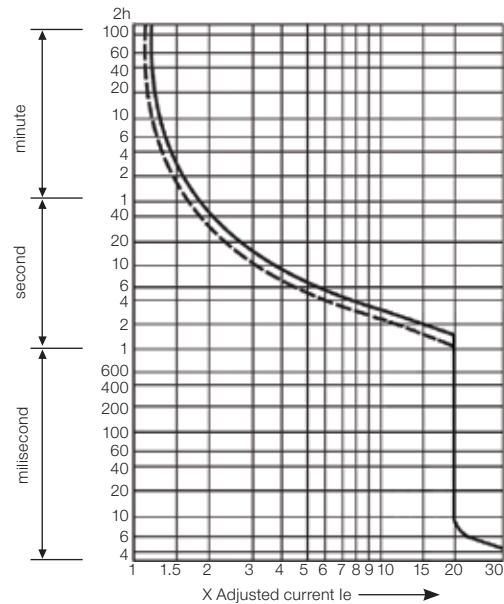

The tripping characteristic shows the motor circuit breaker trip time in relation to the rated current.

The curves show average tolerance range values for an ambient temperature of 20 °C, starting in cold state. Thermal trip time when working in operating temperature is reduced to around 25% of the presented values. Under normal operating conditions, all 3 circuit breaker phases must be conducting.

Motor Starter Guide up to 18.5 kW / 25 HP

Motor Starters

Complementing the new CWB line of contactors, WEG is also launching the 45 mm wide motor protective circuit breakers, MPW40 of 0.16 to 40 A and MPW18 of 0.16 up to 18 A, and the thermal overload relay RW27-2D of 0.28 to 40 A, with the same visual pattern and identity of the WEG brand.

With the new CWB line of contactors, MPW motor protective circuit breaker and the RW27-2D thermal overload relay, WEG now offers a complete and compact line of starters that stands out on the market with:

Easy Installation

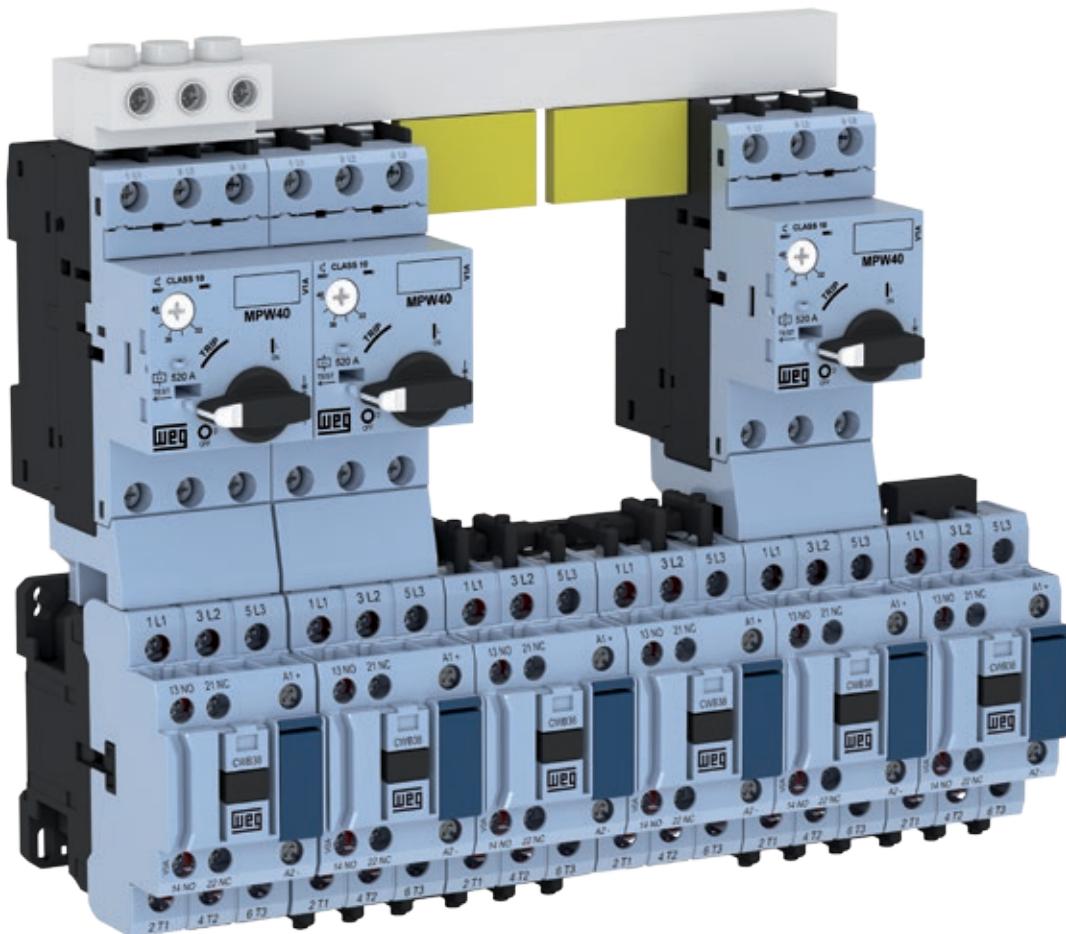

- CWB contactors, overload relays and motor protective circuit breakers in compact design up to 38 A (18.5 kW @ 380/415 V)
 - Easy connection busbars and connectors for DOL, reversing and star-delta starters saving assembly time
 - Easy combination among all starter components
 - Contactors with built-in 1NO + 1NC auxiliary contacts

Easy Panel Optimization

- 45 mm up to 38 A
 - 9 mm wide side auxiliary contact blocks
 - Very compact starters
 - Mechanical interlock with “zero” additional side space
 - Simple and reliable components

Easy Operation

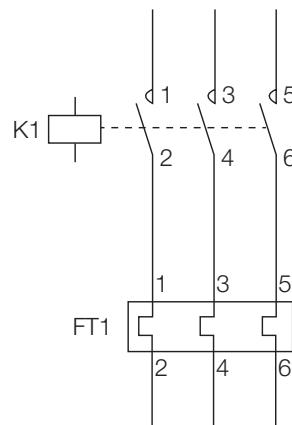

- High performance and reliability for a wide variety of applications
 - Energy savings
 - No inrush current on pick-up for DC operated contactors
 - Integrated overload and/or short-circuit protection
(when using MPW)

Direct On Line Starter

CWB Contactor + RW27-2D Thermal Overload Relay

- Hand / auto / reset button
- Overload protection
- Allows assembly on a DIN rail by fixing a single component
- Remote load switching
- Phase-loss sensitivity
- Tripping class 10
- Temperature compensation

MPW18 Motor Protective Circuit Breaker + CWB Contactor

- Supply disconnecting device acc. to IEC 60204-1
- Pushbutton operated
- Short-circuit protection
- High short-circuit breaking capacity
- Fixed short-circuit release 13xlu
- Overload protection
- Allows assembly on a DIN rail by fixing a single component
- Remote load switching
- Phase-loss sensitivity
- Tripping class 10
- Temperature compensation

Note: WEG W22 Motor - Cast Iron Frame High Efficiency - IE2.

4 poles - Standard Frame - IEC Standard - 50 Hz - Duty S1 - Service factor 1.00.

Orientative Table - Three Phase Motors 60 Hz

$$I_n \text{ (A)} = \frac{P \text{ (W)}}{V \times \sqrt{3} \times \cos\varphi \times \eta}$$

I_n (A) = rated current

P (W) = power

V = rated voltage

cosφ = power factor

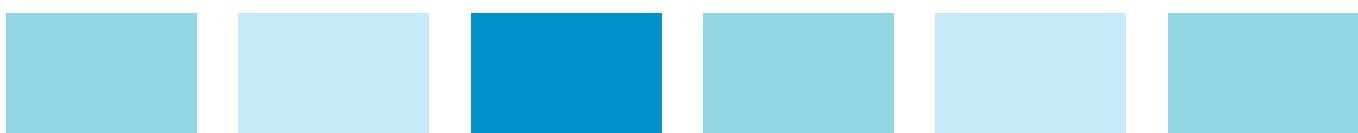

η = efficiency

Output		Rated current I _n			Locked rotor current (I _L /I _n)	Locked rotor time	Frame	Efficiency (%)			Power factor
